The American Academy of Pediatrics recognizes insufficient sleep in adolescents as an important public health issue that significantly affects the health and safety, as well as the academic success, of our nation's middle and high school students. Although a number of factors, including biological changes in sleep associated with puberty, lifestyle choices, and academic demands, negatively affect middle and high school students' ability to obtain sufficient sleep, the evidence strongly implicates earlier school start times (ie, before 8:30 AM) as a key modifiable contributor to insufficient sleep, as well as circadian rhythm disruption, in this population. Furthermore, a substantial body of research has now demonstrated that delaying school start times is an effective countermeasure to chronic sleep loss and has a wide range of potential benefits to students with regard to physical and mental health, safety, and academic achievement. The American Academy of Pediatrics strongly supports the efforts of school districts to optimize sleep in students and urges high schools and middle schools to aim for start times that allow students the opportunity to achieve optimal levels of sleep (8.5–9.5 hours) and to improve physical (eg, reduced obesity risk) and mental (eg, lower rates of depression) health, safety (eg, drowsy driving crashes), academic performance, and quality of life. *Pediatrics* 2014;134:642–649

FACTORS INFLUENCING INSUFFICIENT SLEEP IN ADOLESCENTS

Insufficient sleep represents one of the most common, important, and potentially remediable health risks in children,^{1,2} particularly in the adolescent population, for whom chronic sleep loss has increasingly become the norm.³ The reasons behind the current epidemic of insufficient sleep are complex and interrelated. From a biological perspective, at about the time of pubertal onset, most adolescents begin to experience a sleep–wake “phase delay” (later sleep onset and wake times), manifested as a shift of up to 2 hours relative to sleep–wake cycles in middle childhood.⁴ Two principal biological changes in sleep regulation are thought to be responsible for this phenomenon.^{5,6} One factor is delayed timing of nocturnal melatonin secretion across adolescence^{5,7,8} that parallels a shift in circadian phase preference from more “morning” type to more “evening” type, which consequently results in difficulty falling asleep at an earlier bedtime.⁴ The second biological factor is an altered “sleep drive” across adolescence, in which the pressure to fall asleep accumulates more slowly, as demonstrated by the adolescent brain's response to sleep loss⁹

and by a longer time to fall asleep after being awake for 14.5 to 18.5 hours in postpubertal versus prepubertal teenagers.¹⁰ Thus, these 2 factors typically make it easier for adolescents to stay awake later. At the same time, several studies from different perspectives indicate that adolescent sleep needs do not decline from preadolescent levels, and optimal sleep for most teenagers is in the range of 8.5 to 9.5 hours per night.^{5,11,12} On a practical level, this research indicates that the average teenager in today's society has difficulty falling asleep before 11:00 PM and is best suited to wake at 8:00 AM or later.^{4,12,13}

The sleep–wake changes that flow from this biological maturation may enable teenagers' interactions with such environmental factors and lifestyle/social demands as homework, extra-curricular activities, after-school jobs, and use of technology.^{14–16} As a result, most teenagers stay up late on school nights, getting too little sleep, and then sleep in on weekends to “catch up” on sleep. Although this weekend oversleeping can help offset the weekly sleep deficit, it can worsen circadian disruption and morning sleepiness at school.^{9,17,18}

The Extent and Effects of Adolescent Sleep Loss

Given both biological demands and today's sociocultural influences, it is not surprising that many studies have documented that the average adolescent in the United States is chronically sleep deprived and pathologically sleepy (ie, regularly experiencing levels of sleepiness commensurate with those of patients with sleep disorders such as narcolepsy).¹⁹ For example, a recent National Sleep Foundation poll²⁰ found that 59% of sixth- through eighth-graders and 87% of high school students in the United States were getting less than the recommended 8.5 to 9.5 hours of sleep on school

nights; indeed, the average amount of school night sleep obtained by high school seniors was less than 7 hours. In this same survey, however, 71% of parents believed that their adolescent was obtaining sufficient sleep. This mismatch indicates a significant lack of awareness among adults regarding the extent of adolescent sleep loss. As a result, many middle and high school students are at risk for adverse consequences of insufficient sleep, including impairments in mood, affect regulation, attention, memory, behavior control, executive function, and quality of life (Table 1).^{21–26}

Insufficient sleep also takes a toll on academic performance. In the National Sleep Foundation poll cited previously,²⁰ 28% of students reported falling asleep in school at least once a week, and more than 1 in 5 fell asleep doing homework with similar frequency. Many studies show an association between decreased sleep duration and lower academic achievement at the middle school, high school, and college levels, as well as higher rates of absenteeism and tardiness and decreased readiness to learn (Table 1).^{17,27–30}

An increased prevalence of anxiety and mood disorders has also been linked to poor quality and insufficient sleep in adolescents.^{31–33} Other specific health-related effects of sleep loss include increased use of stimulants (eg, caffeine, prescription medications) to counter the effects of chronic sleepiness on academic performance.^{34,35} Adolescents are also at greater risk of drowsy driving–related crashes as a result of insufficient sleep.^{36,37} Chronic sleep restriction increases subsequent risk of both cardiovascular disease and metabolic dysfunction, such as type 2 diabetes mellitus.^{38,39} An association between short sleep duration and obesity in children and adolescents has been demonstrated in several cross-sectional and prospective

studies, underscoring how chronic sleep restriction can undermine health (Table 1).^{40,41}

IDENTIFYING SOLUTIONS: THE ROLE OF DELAYING SCHOOL START TIMES

This “epidemic” of delayed, insufficient, and erratic sleep patterns among adolescents and the accompanying negative effects on adolescent health and well-being highlight the importance of identifying potentially modifiable factors. The quest to reduce the high cost of sleep loss in adolescents is not only an important public health issue but one of paramount importance to educators, pediatric health care providers, and

TABLE 1 Impact of Chronic Sleep Loss in Adolescents

Physical health and safety
Increased obesity risk
Metabolic dysfunction (hypercholesterolemia, type 2 diabetes mellitus)
Increased cardiovascular morbidity (hypertension, increased risk of stroke)
Increased rates of motor vehicle crashes (“drowsy driving”)
Higher rates of caffeine consumption; increased risk of toxicity/overdose
Nonmedical use of stimulant medications; diversion
Lower levels of physical activity
Mental health and behavior
Increased risk for anxiety, depression, suicidal ideation
Poor impulse control and self-regulation; increased risk-taking behaviors
Emotional dysregulation; decreased positive affect
Impaired interpretation of social/emotional cues in self and others
Decreased motivation
Increased vulnerability to stress
Academics and school performance
Cognitive deficits, especially with more complex tasks
Impairments in executive function (working memory, organization, time management, sustained effort)
Impairments in attention and memory
Deficits in abstract thinking, verbal creativity
Decreased performance efficiency and output
Lower academic achievement
Poor school attendance
Increased dropout rates

advocates for adolescent health. Although many changes over the course of adolescence can affect the quality and quantity of sleep, one of the most salient and, arguably, most malleable is that of school start times. Numerous studies have demonstrated that early start times impede middle and high school students' ability to get sufficient sleep. Studies comparing high schools with start times as little as 30 minutes earlier versus those with later start times demonstrate such adverse consequences as shorter sleep duration, increased sleepiness, difficulty concentrating, behavior problems, and absenteeism.^{29,30,42–46} For example, in one key school transition study, Carskadon et al¹⁹ evaluated the effects of a 65-minute advance (ie, move earlier) in school start time from grade 9 to grade 10 in 40 students. They found a delay in the biological markers of circadian timing but also objectively measured daytime sleepiness levels typical of patients with sleep disorders. Because circadian-based phase delays emerge at around the time of pubertal onset, they also affect younger adolescents, who increasingly are subject to many of the same environmental and lifestyle competing priorities for sleep as older teenagers. Recent research shows that delaying school start times for middle school students is accompanied by positive outcomes similar to those found in high schools, including later rise times, more school night total sleep, less daytime sleepiness, decreased tardiness rates, improved academic performance, and better performance on computerized attention tasks.^{30,47,48}

According to the US Department of Education statistics for 2011–2012,⁴⁹ approximately 43% of the over 18 000 public high schools in the United States currently have a start time before 8:00 AM. Over the last 15 years, however, a small but growing number of

school districts have responded to research reports regarding insufficient sleep among middle and high school students with what may be viewed as a “systematic countermeasure” to reduce the prevalence of sleepiness and its consequences: delaying school start times. Early studies addressed a core question: “Does delaying start time result in students obtaining more sleep, or do students just stay up later and thus negate the effects of the delayed start time?” Wahlstrom et al^{50,51} assessed more than 18 000 high school students in Minneapolis before and after the district's school start time changed from 7:15 AM to 8:40 AM beginning with the 1997–1998 school year. Bedtimes after the change were similar (ie, did not shift to a later time) to those of students in schools that did not change start times, and, as a result, students obtained nearly 1 additional hour of sleep on school nights during the 1999–2000 school year. Other studies have also failed to show a delay in bedtime in response to delayed start times. In a study involving grades 6 through 12 in a school district that delayed high school start times by 1 hour (7:30 to 8:30 AM), students averaged 12 to 30 minutes more nightly sleep, and the percentage of students who reported ≥ 8 hours of sleep increased from 37% to 50%.⁵² Owens et al,⁵³ in a study of adolescents attending an independent school that instituted a start time delay of 30 minutes (from 8:00 to 8:30 AM), reported that average bedtimes actually shifted *earlier* by an average of 18 minutes, and mean self-reported school night sleep duration increased by 45 minutes. In addition, the percentage of students getting less than 7 hours of sleep decreased by 79%, and those reporting at least 8 hours of sleep increased from 16% to 55%. Finally, in a 3-year study of >9000 students from 8 public high schools in 3 states (Colorado, Wyoming, and Minnesota),

the percentage of students sleeping ≥ 8 hours per night was dramatically higher in those schools that had a later start time (eg, 33% at 7:30 AM vs 66% at 8:55 AM).⁵⁴

Moreover, a number of studies have now clearly demonstrated that delaying school start times not only results in a substantive increase in average sleep duration but also has a significant positive effect on a variety of key outcomes; these effects range from decreased levels of self-reported sleepiness and fatigue to improvements in academic measures. In the Minneapolis study,^{50,51} attendance rates for students in grades 9 through 11 improved, and the percentage of high school students continuously enrolled increased. Likewise, Dexter et al⁴² found that public high school sophomores and juniors at a later- versus earlier-starting high school reported more sleep and less daytime sleepiness. Htwe et al⁵⁵ reported that high school students slept an additional 35 minutes, on average, and experienced less daytime sleepiness after their school start time was delayed from 7:35 to 8:15 AM.

Improvements in academic achievement associated with delayed start times have been somewhat less consistently demonstrated; in the Minneapolis study, grades showed a slight but not statistically significant improvement,⁵⁰ and standardized test scores were not increased overall compared with those before the start time change.^{46,56} However, several recent studies have documented improvements in academic performance associated with later start times. A study of students in Chicago public high schools demonstrated that absences were much more common and student grades and test score performance were notably lower for first-period classes compared with afternoon classes and that performance on end-of-year

subject-specific standardized tests (ie, math, English) correlated with whether the student was scheduled for that subject during first period.⁵⁶ Similarly, first-year Air Force Academy students assigned to start classes after 8:00 AM (compared with before 8:00 AM) performed better in their first-period course and, in addition, had a 0.15 SD increase in performance across all of their courses.⁴⁴ In a study focusing on middle school students,⁴⁵ a 1-hour later shift in school start times was associated with an increase in reading test scores by 0.03 to 0.10 SD and in math test scores by 0.06 to 0.09 SD. The author concluded that an increase in start times by 1 hour would result in a 3 percentile point gain in both math and reading test scores for the average student. Furthermore, students performing in the lower end of the test score distribution seemed to benefit most, with gains roughly twice those in above-average students, and the effects persisted into high school. In a more recent middle school study by the same research group, the results suggested that moving school start later by 1 hour can have an impact on standardized test scores comparable to decreasing the class size by one-third. Finally, in a recent 3-state study, 5 of the 6 high schools in which grade point average was assessed showed a significant pre-post increase in grade point average in core subjects of math, English, science, and social studies.⁵⁴

Finally, there may be additional health-related and other benefits associated with delays in start time. For example, students in the independent school study cited previously⁵³ reported significantly more satisfaction with their sleep. In addition, class attendance improved, as did health-related variables, including fewer visits to the campus health center for fatigue-related complaints.⁵³ Although not specifically

assessed as an outcome in previous research, later start times might increase the likelihood that students will eat breakfast before school and thus further enhance their readiness to learn.⁵⁷ Finally, improvements in teacher satisfaction linked to increased sleep offers yet another potential mechanism for classroom enrichment.

Several other outcome measures examined in these studies also deserve emphasis. In the study by Owens et al,⁵³ there were significantly fewer students self-reporting symptoms of depressed mood as well as improved motivation after the start time delay. In a more recent study, also conducted in an independent school setting, a 25-minute delay in start time was associated not only with increased sleep duration and decreased daytime sleepiness but also with less self-reported depressed mood.⁵⁸ Although more research is needed, given the mounting evidence supporting a bidirectional link between sleep patterns and problems and mood disorders in this population⁵⁹ (including an increased risk of suicidal ideation⁵⁷), countermeasures that could potentially mitigate these effects have important public health implications.

Furthermore, adolescents are at particularly high risk of driving while impaired by sleepiness, and young drivers aged 25 years or younger are involved in more than one-half of the estimated 100 000 police-reported, fatigue-related traffic crashes each year.⁶⁰ Danner and Phillips⁵² examined the relationship between automobile crash records for students 17 to 18 years of age and high school start times. Car crash rates for the county that delayed school start times decreased by 16.5% over the 2 years before and after the school-start change, whereas those for the state as a whole increased by 7.8% across the same time period. In another recent study conducted in

2 adjacent, demographically similar cities, there were significantly increased teen (16- to 18-year-olds) crash rates over a 2-year period in the city with earlier high school start times (2007: 71.2 per 1000 vs 55.6 per 1000; 2008: 65.8 per 1000 vs 46.6 per 1000 [$P < .001$]), and teen drivers' morning crash peaks occurred 1 hour earlier.⁶¹ Finally, the recent study by Wahlstrom et al⁵⁴ found a crash rate reduction in 16- to 18-year-olds of 65% and 70%, respectively, in 2 of the 4 high schools studied; notably, the high school with the latest start time (Jackson Hole, WY) had the largest decline in car crashes.

Although considerable empiric support exists for the concepts that early school start times are detrimental to adolescents' health and well-being and that delaying school start times results in substantive and sustained benefits to students, the ongoing debate among school districts in the United States regarding the widespread institution of later start times for middle and high schools continues to spark controversy. Moreover, the logistical considerations in implementing delayed school start times in middle and high schools are far from trivial. Wolfson and Carskadon⁶² surveyed 345 public high school personnel regarding their perspective on high school start times, factors influencing school start times, and decision-making around school schedules. Most respondents at that time had not changed or contemplated changing their school start times. Perceived barriers to changing school schedules commonly endorsed included curtailed time for athletic practices and interference with scheduling of games, reduced after-school employment hours for students, challenges in providing child care for younger siblings, adjustments in parent and family schedules, potential safety issues, effects on sleep duration in younger children if

elementary school schedules are “flipped” with those of middle/high school students, and the need to make alternative transportation arrangements. However, to date, to our knowledge, there have been no published studies that have systematically examined the impact of school start time delay on these parameters, although anecdotal evidence suggests that many of these concerns are unfounded (www.sleepfoundation.org). Moreover, communities across the country have adopted a variety of creative solutions to address these problems, including shifting to public transportation for older students, enlisting community volunteers to provide supervision at bus stops, adjusting class schedules to minimize late dismissal times, scheduling free periods/study halls at the end of the school day to allow participation in after-school extracurricular activities, exempting student athletes from physical education requirements, and installing lights for athletic fields.

In addition, as outlined in a recent Brookings Institute Report (“Organizing Schools to Improve Student Achievement: Start Times, Grade Configurations, and Teacher Assignments”),⁶³ economists have suggested that delaying school start times would have a substantial benefit-to-cost ratio (9:1). This finding is based on a conservative estimate of both costs per student (\$0–\$1950, largely related to transportation) and the increase in projected future earnings per student in present value because of test score gains related to moving start times 1 hour later (approximately \$17 500). Finally, because the appropriation of federal dollars for schools is partially dependent on student attendance data, reducing tardiness and absenteeism levels could result in increased funding and further offset costs related to moving start times later.

CONCLUSIONS

Taken together, these studies support the presence of significant improvements in benchmarks of health and academic success in a variety of settings in association with later school start times, including in urban school districts with a large percentage of low-income and minority students, suburban public schools, and college-preparatory independent schools. It is clear that additional research is needed to further document the effects of changes in school start times over time, to examine specific factors that increase or decrease the likelihood of positive outcomes, and to assess the effect on families, the community, other stakeholders, and the educational system in general. However, it may be strongly argued that both the urgency and the magnitude of the problem of sleep loss in adolescents and the availability of an intervention that has the potential to have broad and immediate effects are highly compelling.

It should also be emphasized that delaying school start times alone is less likely to have a significant effect without concomitant attention to other contributing and potentially remediable factors, such as excessive demands on students’ time because of homework, extracurricular activities, after-school employment, social networking, and electronic media use. One of the biggest challenges school districts face is the need to inform community stakeholders (eg, parents, teachers and administrators, coaches, students, bus drivers, businesses that employ students, law enforcement officials) about the scientific rationale underpinning the merits of delaying school start times; the threats to health, safety, and academic success posed by insufficient sleep; and the potential benefits for adolescents of school start time delay. Thus, education and community engagement are equally

key components in increasing the likelihood of success.

The American Academy of Pediatrics recognizes insufficient sleep in adolescents as a public health issue, endorses the scientific rationale for later school start times, and acknowledges the potential benefits to students with regard to physical and mental health, safety, and academic achievement. The American Academy of Pediatrics lends its strong support to school districts contemplating delaying school start times as a means of optimizing sleep and alertness in the learning environment and encourages all school administrators and other stakeholders in communities around the country to review the scientific evidence regarding school start times, to initiate discussions on this issue, and to systematically evaluate the community-wide impact of these changes (eg, on academic performance, school budget, traffic patterns, teacher retention).

RECOMMENDATIONS

1. Pediatricians should educate adolescents and parents regarding the optimal sleep amount teenagers need to match physiologic sleep needs (8.5–9.5 hours). Although napping, extending sleep on weekends, and caffeine consumption can temporarily counteract sleepiness, these measures do not restore optimal alertness and are not a substitute for regular sufficient sleep.
2. Health care professionals, especially those working in school-based clinics or acting in an advisory capacity to schools, should be aware of adolescent sleep needs. They should educate parents, teenagers, educators, athletic coaches, and other stakeholders about the biological and environmental factors, including early school start times, that contribute to widespread chronic sleep deprivation in America’s youth.

3. Educational interventions for parents and adolescents as well as the general public should be developed and disseminated by the American Academy of Pediatrics and other child and sleep health advocacy groups. Content should include the potential risks of chronic sleep loss in adolescents, including depressed mood, deficits in learning, attention and memory problems, poor impulse control, academic performance deficits, an increased risk of fall-asleep motor vehicle crashes, and an elevated risk of obesity, hypertension, and long-term cardiovascular morbidity. Information should also be included about the potential utility of systemic countermeasures, including delaying school start times, in mitigating these effects. Finally, educational efforts should also emphasize the importance of behavior change on the individual level and the personal responsibility that families and students themselves have in modifying their sleep habits.
4. Pediatricians and other pediatric health care providers (eg, school physicians, school nurses) should provide scientific information, evidence-based rationales, guidance, and support to educate school administrators, parent-teacher associations, and school boards about the benefits of instituting a delay in start times as a potentially highly cost-effective countermeasure to adolescent sleep deprivation and sleepiness. In most districts, middle and high schools should aim for a starting time of no earlier than 8:30 AM. However, individual school districts also need to take average commuting times and other exigencies into

account in setting a start time that allows for adequate sleep opportunity for students. Additional information regarding opportunities, challenges, and potential solutions involved in changing school start times may be found at: <http://www.sleepfoundation.org/article/sleep-topics/school-start-time-and-sleep>; <http://schoolstarttime.org>.

5. Pediatricians should routinely provide education and support to adolescents and families regarding the significance of sleep and healthy sleep habits as an important component of anticipatory guidance and well-child care. In particular, pediatricians should endorse parental involvement in setting bedtimes and in supervising sleep practices, such as social networking and electronic media use in the bedroom; for example, pediatricians could recommend to parents that they establish a “home media use plan” and enforce a “media curfew.” Adolescents should be regularly queried regarding sleep patterns and duration and counseled about the risks of excessive caffeine consumption, misuse of stimulant medications as a countermeasure to sleepiness, and the dangers of drowsy driving.

Screening for Nonviral Sexually Transmitted Infections in Adolescents and Young Adults

.....

- *Policy Statement*

POLICY STATEMENT

Screening for Nonviral Sexually Transmitted Infections in Adolescents and Young Adults

abstract

FREE

Prevalence rates of many sexually transmitted infections (STIs) are highest among adolescents. If nonviral STIs are detected early, they can be treated, transmission to others can be eliminated, and sequelae can be averted. The US Preventive Services Task Force and the Centers for Disease Control and Prevention have published chlamydia, gonorrhea, and syphilis screening guidelines that recommend screening those at risk on the basis of epidemiologic and clinical outcomes data. This policy statement specifically focuses on these curable, nonviral STIs and reviews the evidence for nonviral STI screening in adolescents, communicates the value of screening, and outlines recommendations for routine nonviral STI screening of adolescents. *Pediatrics* 2014;134:e302–e311

EVIDENCE TO SUPPORT NONVIRAL STI SCREENING

The goal of sexually transmitted infection (STI) screening is to identify and treat individuals with treatable infections, reduce transmission to others, avoid or minimize long-term consequences, identify other exposed and potentially infected individuals, and decrease the prevalence of infection in a community. Healthy People 2020 objectives for sexually transmitted diseases¹ include items that address screening for chlamydia in sexually active females younger than 25 years and set targets for decreased rates of chlamydia, gonorrhea, and syphilis in specific populations. The US Preventive Services Task Force (USPSTF), an independent panel of prevention and evidence-based medicine experts, has published chlamydia,² gonorrhea,³ and syphilis^{4,5} screening guidelines that recommend screening those at risk on the basis of epidemiologic and clinical outcomes data. The Centers for Disease Control and Prevention (CDC) publishes evidence-based STI screening recommendations for specific at-risk populations that are not addressed by the USPSTF but that pose public health challenges for disease prevention and control.^{6–8} Major professional medical organizations, including the American College of Obstetricians and Gynecologists and the American Academy of Family Physicians, have also published STI screening guidelines for specific populations.^{7–10} The American Academy of Pediatrics' (AAP) Bright Futures guidelines for health supervision recommend chlamydia and gonorrhea screening as appropriate for the patient population and the clinical setting.¹¹ Recent AAP clinical reports addressing gynecologic examinations and male reproductive and sexual health care discuss clinic issues and provider

skills that are relevant to office-based screening for nonviral STIs.^{12,13} These clinical reports and CDC recommendations⁶ describe the important elements of a sexual history. The goal of this policy statement is to review the evidence in support of nonviral STI screening in adolescents and to educate pediatricians about the value of screening as well as resources available to support this practice. Screening considerations from the CDC specific to pregnant and HIV-infected individuals should be reviewed (www.cdc.gov/std/treatment).⁶ Guidance about how to incorporate chlamydia screening into the office setting including addressing confidentiality, billing, and explanation of benefits statements can be found at the National Chlamydia Coalition Web site (<http://ncc.prevent.org/info/healthcare-providers>). This site provides a link to up-to-date resources and a monograph titled *Why Screen for Chlamydia; An Implementation Guide for Healthcare Providers*. The AAP policy statement addressing standards for Health Information Technology to ensure adolescent privacy may be useful in the establishment of practice procedures and help anticipate questions regarding confidentiality.¹⁴

CHLAMYDIA

Importance

Chlamydia trachomatis is the most common reportable communicable disease in the United States, with the highest case rates occurring in female 20- to 24-year-olds followed closely by rates in female 15- to 19-year-olds.⁸ Chlamydia is common among all races and ethnic groups; however, large racial disparities in chlamydial burden exist, and young women and men of color are disproportionately affected.^{8,15} Among sexually active female 15- to 19-year-olds, chlamydia prevalence among non-Hispanic African Americans is more

than 5 times the prevalence among non-Hispanic whites (7719/100 000 population vs 1458/100 000).⁸ In male 15- to 19-year-olds, in whom the rates have increased every year since 2006, the rate of chlamydia infection among non-Hispanic African Americans is 10 times the rate in non-Hispanic whites (2334/100 000 population vs 236/100 000).⁸ Rates for American Indian/Alaskan Native and Hispanic populations are between the rates for African American and white populations.

Most chlamydia infections are asymptomatic and may persist if left untreated. Previous infection does not confer any clinically reliable protective immunity.¹⁶ Vaccines are not available for chlamydia or for any of the subsequently discussed nonviral STIs. Chlamydia can manifest as cervicitis, urethritis, proctitis, and uncommonly, pharyngitis. Complications and sequelae may include pelvic inflammatory disease (PID), tubal-factor infertility, ectopic pregnancy,^{6,17} chronic pelvic pain,¹⁸ increased HIV transmission,^{19–23} adverse pregnancy and infant outcomes,²⁴ neonatal infections,²⁵ epididymitis,²⁶ and reactive arthritis.^{16,27}

Background

The USPSTF, AAP, and American Academy of Family Physicians recommend annual chlamydia screening of all sexually experienced females younger than 25 years. The CDC and American College of Obstetricians and Gynecologists recommend annual routine screening of sexually experienced females through the age of 25 years. The National Commission on Prevention Priorities ranked chlamydia screening of young women as 1 of the 10 most beneficial and cost-effective preventive services but also among the most underutilized.²⁸

The USPSTF found insufficient evidence to recommend for or against routine chlamydia screening of young men.

Because the risk of complications or long-term reproductive sequelae for chlamydia-infected males is low, screening asymptomatic males does not offer substantial secondary prevention for them. In addition, male older adolescents/young adults are less likely than their female counterparts to use health care services and thus may be difficult to reach with a chlamydia screening program.²⁹ However, the CDC recommends considering screening young men in clinical settings with high chlamydia prevalence rates, such as jails or juvenile corrections facilities, national job training programs, and STD, high school, or adolescent clinics, when resources permit.^{6,30} Males in these settings with a history of multiple partners are at greatest risk of asymptomatic chlamydia infection.^{31–33} The CDC also recommends chlamydia screening of males who have sex with males (MSM) at least annually for urethral and rectal infection on the basis of reported sexual practices and every 3 to 6 months if considered high risk because of multiple or anonymous partners, sex in conjunction with illicit drug use, or having sex partners who participate in these activities.⁶ Sex partners of chlamydia-infected individuals during the 60 days before the diagnosis should also be targeted for testing and treatment because of their high likelihood of infection.⁶

Laboratory Testing

Detection of genitourinary chlamydia infections has substantially improved over the past 2 decades. Nucleic acid amplification tests (NAATs) are preferred for *C trachomatis* detection in adolescents and young adults, regardless of symptoms.³⁴ *C trachomatis* NAATs are sensitive and specific and licensed for use with urine, urethral, vaginal, and cervical specimens. Many of the chlamydia NAATs are approved by the Food and Drug Administration

(FDA) to test patient-collected vaginal swabs in the clinical setting and liquid cytology specimens.^{34,35} Among all of the aforementioned specimens, female vaginal swab specimens and male first-void urine are considered the optimal specimen types.³⁴ Female urine remains an acceptable chlamydia NAAT specimen but may have slightly reduced performance compared with cervical or vaginal swab specimens.³⁴ The CDC recommends at least an annual urine chlamydial NAAT for urethral infection for MSM who have had insertive anal intercourse and an annual rectal swab chlamydial NAAT for those who have had receptive anal intercourse.⁶ Although chlamydia NAATs are not approved by the FDA for rectal swab specimen testing, laboratories that have met Clinical Laboratory Improvement Amendment (CLIA) and other regulatory requirements and validated chlamydia NAAT performance on rectal swab specimens may perform these tests.^{6,34,36} In the evaluation of the sexual assault victim, NAATs may be used for female vaginal swab and urine specimens. Some jurisdictions may prefer *C. trachomatis* culture from all sites in lower-prevalence populations because of greater specificity, although sensitivity may be compromised.⁶

Disease-Specific Benefits and Risks of Screening

In randomized clinical trials, screening asymptomatic sexually active young women for chlamydia and treating those identified with infection reduced the risk of subsequent PID.^{37,38} Other studies, summarized by Haggerty et al, support the association of repeated chlamydia infection with increased reproductive sequelae.¹⁸

Clinical Considerations

Because reinfection is common, providers should rescreen all male and

female patients treated for chlamydia approximately 3 months after treatment. If retesting at 3 months is not possible, retest whenever patients next present for health care services in the 12 months after the initial treatment. A systems-based approach of collecting a noninvasive specimen on all females before they are seen by the health care provider, such as during nursing triage, enhances the proportion of sexually active females who are screened.^{39–41} The National Chlamydia Coalition produces resources for health care providers to facilitate office-based chlamydia screening.⁴² Internet-based interventions to promote chlamydia screening with self-collected vaginal swab specimens in various nonclinical settings are also being evaluated.^{43,44}

GONORRHEA

Importance

Gonorrhea is the second most common reportable communicable disease in the United States; female 20- to 24-year-olds have the highest and female 15- to 19-year-olds the second highest reported gonorrhea case rates compared with any other age or gender.⁸ Substantial racial disparity exists for gonorrhea. The 2012 reported rates among male and female non-Hispanic African American 15- to 19-year-olds are 26 times and 15 times those of male and female non-Hispanic white 15- to 19-year-olds, respectively.⁸ A recent study has shown that residential segregation of black populations contributes to the large racial disparity for youth by creating distinct social networks that perpetuate the persistence of their endemically high gonorrhea rates.⁴⁵ Rates for American Indian/Alaskan native and Hispanic populations are between the rates for non-Hispanic African American and non-Hispanic white populations.

As with *C. trachomatis*, many infections are asymptomatic, and *Neisseria gonorrhoeae* can cause cervicitis, urethritis, proctitis, and pharyngitis. On occasion, gonorrhea may also lead to conjunctivitis.⁴⁶ Uncomplicated gonorrhea infection can spread to the upper genital tract, causing PID and associated longer-term complications, such as ectopic pregnancy, infertility, and chronic pelvic pain in females and epididymitis in males, and hematogenous spread can cause disseminated gonococcal infection. Gonorrhea infection is also associated with increased HIV transmission.⁴⁷ In pregnancy, gonorrhea is associated with chorioamnionitis, premature rupture of membranes, and preterm labor. Perinatal transmission can lead to ophthalmia neonatorum. Rarely, newborn infants develop life-threatening systemic disease from gonorrhea acquired during delivery through an infected birth canal.²⁵

Background

The USPSTF recommends annual gonorrhea screening of all at-risk, sexually active females.³ Populations at highest risk of gonorrhea infection include females and males younger than 25 years and individuals with a history of previous gonorrhea infection, other STIs, new or multiple sex partners, inconsistent condom use, or who engage in sex work or drug use. The USPSTF found insufficient evidence to recommend for or against routine gonorrhea screening of asymptomatic males because of the low prevalence rates and the lower rates of morbidity related to untreated gonorrhea infection in males and because asymptomatic infection is less common in males than in females.

The CDC recommends urethral, rectal, and oropharyngeal gonorrhea testing at least annually for MSM who engage in receptive anal or oral intercourse, respectively, as well as urine-based

testing at least annually for MSM engaging in insertive anal or oral intercourse.^{6,34,48} The CDC also recommends gonorrhea screening every 3 to 6 months for MSM who are at higher risk because of multiple or anonymous partners, sex in conjunction with illicit drug use (especially methamphetamines), or partners who participate in these activities.^{6,49,50}

Sex partners of gonorrhea-infected individuals during the 60 days before gonorrhea diagnosis should be targeted for testing and treatment because of their high likelihood of infection.⁶ Because gonorrhea rates vary widely by communities and population, health care providers should consider local gonorrhea epidemiology to determine if gonorrhea screening in male adolescents is appropriate in their patient population.

Laboratory Testing

Recent shifts have occurred in *N gonorrhoeae* screening options. NAATs are recommended for detection of genitourinary gonococcal infections in males and females, regardless of symptoms.^{6,34} Gonorrhea and chlamydia NAATs are usually available as combination tests from a single specimen. Like those for chlamydia, *N gonorrhoeae* NAATs have high sensitivity and specificity. Most are approved by the FDA for use with urine and urethral, vaginal, and cervical swab specimens in the clinical setting. Some gonorrhea NAATs are also licensed to test patient-collected vaginal swab specimens in a clinical setting and liquid cytology specimens. Among all specimens, female vaginal swab specimens and male urine are the optimal specimen types.³⁴

Although gonorrhea NAATs are not approved by the FDA for extragenital sites, many laboratories have met CLIA and other regulatory requirements and validated gonorrhea NAAT testing on

rectal and pharyngeal specimens.^{34,36,51} NAATs cannot be used to determine gonorrhea antimicrobial resistance; thus, culture must be obtained to identify antibiotic-resistant gonorrhea strains,^{8,34} although it has lower sensitivity especially at extragenital sites compared with NAATs. Ideally, gonorrhea culture is needed for evaluating suspected cases of treatment failure, for test of cure for patients who were treated with an alternative regimen, and for investigating suspected childhood sexual abuse or assault.⁶

Disease-Specific Benefits and Risks of Screening

Identification of gonorrhea infection allows for treatment, prevention of sequelae, and identification of exposed partners; reduces further transmission to others; and may be a marker or risk factor for HIV transmission.

Clinical Considerations

Providers should rescreen all male and female patients treated for gonorrhea approximately 3 months after treatment at the anatomic site of infection because reinfection is common. Gonorrhea treatment is challenging because of the organism's ability to readily develop antimicrobial resistance.^{6,8,52,53} The possibility of emerging cephalosporin-resistant *N gonorrhoeae* is a growing concern.⁴⁸ The CDC's Gonococcal Isolate Surveillance Project has documented recent trends of decreasing cephalosporin susceptibility among *N gonorrhoeae*.⁵² Cases of suspected gonorrhea treatment failures should be reported to local or state health departments, and a gonococcal culture of specimens from exposed sites, preferably with simultaneous NAAT and antimicrobial-susceptibility testing, should be performed if *N gonorrhoeae* is isolated.⁶ Patients with a diagnosis of uncomplicated urogenital or rectal gonorrhea who are treated with any of the

recommended or alternative regimens do not need a test-of-cure.⁶ However, patients with pharyngeal gonorrhea who are treated with an alternative regimen should return 14 days after treatment of a test-of-cure, using either culture or NAAT.⁶ If the NAAT is positive, every effort should be made to perform a confirmatory culture.

TRICHOMONIASIS

Importance

Trichomonas vaginalis infection is not a nationally reportable communicable disease; however, *T vaginalis* genital tract infection is believed to be the most common nonviral STI on the basis of population studies.⁵⁴ Unlike chlamydia and gonorrhea infections, which are most common among female adolescents and young adults, trichomoniasis is also common among older females. In adolescent female samples, *T vaginalis* prevalence rates have ranged from 2.1% to 14.4%.^{54–57} Although this infection is commonly asymptomatic in females, *T vaginalis* infection has been associated with vaginitis and PID.^{25,58,59} In some cases, it may cause preterm labor^{60–62} and may increase HIV transmission.^{63,64} The majority of infections (approximately 80%) are also asymptomatic in males, although *T vaginalis* can cause urethritis, epididymitis, and prostatitis.^{65–67} Similar to other STIs, a substantial racial disparity exists, with prevalence rates 10 times higher among female non-Hispanic African Americans compared with their non-Hispanic white and Mexican American counterparts.⁵⁴

Background

Although the USPSTF has not published *T vaginalis* screening recommendations, CDC recommends screening HIV-infected females for *T vaginalis* annually and suggests that screening can be considered in females at high risk of infection, including those with new or multiple

partners, those with a history of STIs, and those who exchange sex for payment or inject drugs.⁶

Laboratory Testing

T vaginalis is often identified through microscopic examination of vaginal secretions on a slide preparation (ie, “wet mount”). This method requires immediate viewing for optimal results and has poor sensitivity (approximately 60%–70%).^{64,68,69} Consequently, false-negative results are common with microscopic identification, and true infections may be underrecognized and undertreated.^{68,70,71} Clinical laboratory tests with greater sensitivity compared with wet mount include trichomonas culture in Diamond media or other trichomoniasis-specific culture systems (eg, InPouch, BioMed Diagnostics, White City, OR); a CLIA-waived, antigen-detection, point-of-care test (OSOM, Sekisui Diagnostics, Exton, PA); and a nucleic acid probe test (Affirm VPIII, Becton, Dickinson and Company, Franklin Lakes, NJ) for *T vaginalis*, *Gardnerella vaginalis*, and *Candida albicans*. A NAAT for *T vaginalis* (APTIMA; GenProbe, San Diego, CA) is available and licensed for use with female cervical or vaginal swab, urine, and PreservCyt Solution specimens. A routine Papanicolaou test should not be used to diagnose *T vaginalis* infection because of poor sensitivity and specificity.⁶ The *T vaginalis* NAAT has also demonstrated superior sensitivity for trichomonas diagnosis in men, but it is not licensed for male specimens.^{64,72} Laboratories that have met CLIA and other regulatory requirements and validated their *T vaginalis* NAAT performance on male specimens may perform this test.^{6,34}

Disease-Specific Benefits and Risks of Screening

Benefits of routine *T vaginalis* screening have not been established. The potential benefits of screening high-risk individuals

for *T vaginalis* are to identify infections and initiate treatment of individuals and their partner(s).⁶

Clinical Considerations

Rescreening for *T vaginalis* at 3 months after treatment can be considered for females, especially HIV-infected females.⁷³ Studies that address this rescreening question for males are not in the literature.

SYPHILIS

Importance

Syphilis, nearly eliminated at the start of the new millennium, has reemerged as a public health threat, primarily among MSM. CDC data demonstrate a significant increase in syphilis among young non-Hispanic black MSM.⁸ During 2008–2012, rates for males increased most significantly among 20- to 24-year-olds. In 2006, the highest reported syphilis rates were among men aged 35 to 39 years; now rates are highest among 20- to 24-year-olds. In 2012, syphilis rates among females decreased overall compared with 2010, although rates remain highest among females aged 20 to 24 years. In 2012, the primary and secondary syphilis rate male-to-female ratio was 10.3:1.⁸ In 2012, 75% of primary and secondary syphilis cases in 49 states and the District of Columbia that provided information about gender of sex partners were among MSM.⁸

Syphilis is a treatable systemic STI caused by the spirochete *Treponema pallidum*. *T pallidum* is transmitted by exposure to the organism, most commonly through sexual contact with infected lesions, such as chancres, or in the blood of a pregnant woman through the placenta to the fetus. The most serious complications of untreated syphilis are neurosyphilis in the adult and congenital syphilis in the offspring of the pregnant female. Congenital syphilis causes a range of

multisystem problems in affected infants, including intrauterine death.²⁵

Background

The USPSTF recommends syphilis screening for individuals of both genders who at increased risk of syphilis infection, such as MSM, adults in corrections facilities, commercial sex workers, people who exchange sex for drugs, contacts of people with infectious syphilis, and pregnant females at the first prenatal visit.^{4,5} Universal syphilis screening is not recommended for nonpregnant females or heterosexual males.⁶ Providers should consult with their local health department regarding local syphilis prevalence and epidemiology, which may influence who they should screen beyond pregnant adolescents and adolescent MSM.^{6,73} The CDC recommends that a syphilis serologic screening test be performed at least annually for sexually active MSM.⁶

Laboratory Testing

Syphilis serologic tests are available to screen for syphilis. A single positive serologic syphilis test result is not diagnostic.^{6,34} A diagnosis of syphilis requires both treponemal and nontreponemal test results, along with a comprehensive clinical evaluation.^{6,34} In the United States, the traditional syphilis laboratory screening strategy is to perform a nontreponemal test, such as a rapid plasma reagin or Venereal Disease Research Laboratory test, followed by a treponemal test, such as a *T pallidum* particle agglutination (TP-PA), enzyme immunoassay, or chemiluminescent immunoassay for confirmation. Alternatively, some clinical laboratories offer the reverse sequence syphilis screening algorithm with treponemal enzyme immunoassay or chemiluminescent immunoassay and confirm active disease with quantitative nontreponemal tests.^{8,34} Additional details on this syphilis testing

algorithm are available from the Association of Public Health Laboratories.^{6,25,74}

Disease-Specific Benefits and Risks of Screening

Benefits of syphilis detection and treatment include the elimination of a potentially serious multisystem disease and prevention of cases of congenital syphilis. Syphilis screening can produce false-positive test results, which require further evaluation.

Clinical Considerations

A recent evidence-based review supports syphilis screening and treatment during pregnancy to prevent congenital syphilis.⁷⁵ People who have symptomatic syphilis might seek treatment of new onset of genital ulcers, lymphadenopathy or cutaneous or mucosal rashes, hair loss, or neurologic symptoms consistent with syphilis^{6,25} and should be tested for it. Follow-up testing is critical to confirm treatment effectiveness.⁶

CLINICAL IMPLICATIONS AND CONCLUSIONS

Female and male adolescents and young adults have high STI prevalence rates compared with other age groups. Certain adolescent populations bear a higher STI burden, such as youth of color and MSM.⁸ A comprehensive sexual history sensitive to ethnic, racial, and cultural factors, including those of sexual minority youth, and a sexual behavior risk assessment (vaginal, oral, and anal sex) should guide sites of specimen collection on the basis of sexual behavior. Clinicians should inquire about same- and opposite-gender sexual partners, regardless of reported sexual orientation. There are few available national data regarding STIs in transgender youth, although older transgender populations are at high risk of STIs, including HIV.^{76,77}

Detection of infection creates the opportunity to treat asymptomatic disease, prevent adverse sequelae, prevent further transmission to others, identify likely infected partners for testing and treatment, and reduce the burden of disease. Risks associated with screening include false-positive results, especially in low-prevalence populations, and false-negative results, which may leave diseases undetected and untreated. A positive screening result for any STI may be associated with self-blame and stigma for some individuals, which may have emotional, behavioral, and relationship repercussions.^{78–81} The presence of any STI puts an individual at greater risk of other STIs, and an evaluation for other STIs, including HIV should be considered. Pediatricians can take an active role in reducing disease prevalence and adverse sequelae by identifying and treating undiagnosed infections in addition to prevention counseling, promotion of condom use and safe sex practices, rescreening infected patients after treatment, and offering expedited partner therapy, where legally permissible and recommended,^{82,83} to prevent new and recurrent infections.⁸⁴

RECOMMENDATIONS

The American Academy of Pediatrics (AAP) recommends the following:

1. Routine laboratory screening for nonviral STIs as per the following published screening recommendations for sexually active adolescents. The following screening recommendations summarize published federal agency and medical professional organizations' clinical guidance for all sexually active adolescents:
 - a. Chlamydia
 - i. Routinely screen all sexually active female adolescents and young adults (≤ 25 years) for *C trachomatis* annually.

- ii. Routinely screen sexually active adolescent and young adult MSM for rectal and urethral chlamydia annually if they engage in receptive anal or insertive intercourse, respectively. Screen every 3 to 6 months if high risk because of multiple or anonymous partners, sex in conjunction with illicit drug use, or having sex partners who participate in these activities.
 - iii. Screen adolescents and young adults exposed to chlamydia in the past 60 days from an infected partner.
 - iv. Consider screening sexually active males annually in settings with high prevalence rates, such as jails or juvenile corrections facilities, national job training programs, STD clinics, high school clinics, and adolescent clinics for patients who have a history of multiple partners.
- b. Gonorrhea
 - i. Routinely screen all sexually active female adolescents and young adults (< 25 years) for *N gonorrhoeae* annually.
 - ii. Routinely screen sexually active adolescent and young adult MSM for pharyngeal, rectal, and urethral gonorrhea infection annually if engaging in receptive oral or anal intercourse or insertive intercourse, respectively. Screen every 3 to 6 months if high risk because of multiple or anonymous partners, sex in conjunction with illicit drug use, or having sex partners who participate in these activities.
 - iii. Screen adolescents and young adults exposed to gonorrhea

in the past 60 days from an infected partner.

- iv. Consider screening other sexually active and young adult males annually on the basis of individual and population-based risk factors, as discussed in the body of the text. For information on local prevalence rates, contact the local or state health departments. CDC gonorrhea surveillance data at state and county levels are available at www.cdc.gov/std/stats/default.htm.

c. Trichomoniasis

Routine *T vaginalis* screening of asymptomatic adolescents is not recommended. However, individual and population-based risk factors, including new or multiple partners, a history of STIs, exchanging sex for payment, or injecting drugs, may put females at higher risk of infection, and they may require a more thorough STI evaluation, including screening for *T vaginalis*.

d. Syphilis

The routine screening of nonpregnant, heterosexual adolescents is not recommended. However, screening is recommended for all sexually active adolescent and young adult MSM annually or every 3 to 6

months if high risk and can be considered for youth whose behaviors put them at higher risk. Providers should consult with their local health department regarding local syphilis prevalence and associated risks that may influence practice decisions.

2. Rescreen all adolescents infected with chlamydia or gonorrhea 3 months after treatment, regardless of whether they believe that their sex partners were treated. Providers should consider rescreening females previously diagnosed with trichomoniasis 3 months after treatment. If retesting at 3 months is not possible, retest whenever patients next present for health care services in the 12 months after initial treatment.
3. Develop clinical procedures using prepared resources to incorporate STI risk assessments, screening and treatment, and prevention counseling into routine health care for sexually active adolescents, which include the following:
 - a. Providing education and training opportunities to staff on procedures and related issues, including consent, confidentiality, and billing.
 - b. Developing competence with non-invasive NAAT screening.

4. Advocate to minimize barriers to STI screening without breaches of confidentiality and to minimize other barriers, including access and stigma.

POLICY STATEMENT

Standards for Pediatric Cancer Centers

abstract

FREE

Since the American Academy of Pediatrics—published guidelines for pediatric cancer centers in 1986, 1997, and 2004, significant changes in the delivery of health care have prompted a review of the role of medical centers in the care of pediatric patients. The potential effect of these changes on the treatment and survival rates of children with cancer led to this revision. The intent of this statement is to delineate personnel, capabilities, and facilities that are essential to provide state-of-the-art care for children, adolescents, and young adults with cancer. This statement emphasizes the importance of board-certified pediatric hematologists/oncologists and appropriately qualified pediatric medical subspecialists and pediatric surgical specialists overseeing patient care and the need for specialized facilities as essential for the initial management and much of the follow-up for pediatric, adolescent, and young adult patients with cancer. For patients without practical access to a pediatric cancer center, care may be provided locally by a primary care physician or adult oncologist but at the direction of a pediatric oncologist. *Pediatrics* 2014;134:410–414

INTRODUCTION

A pediatric cancer center must have the staff and facilities to offer the pediatric patient with cancer treatment that are consistent with the current standard of care for his or her diagnosis. The medical staff at such a center is often composed of the primary care pediatrician, pediatric medical subspecialists, and pediatric surgical specialists such as hematologists/oncologists, surgeons, urologists, neurologists, neurosurgeons, orthopedic surgeons, radiation oncologists, pathologists, palliative care specialists, critical care physicians, emergency medicine specialists, and diagnostic radiologists. At certain institutions, hospitalists, advance practice nurses, and physician assistants may be used to provide continuous around-the-clock care. Physicians, advanced practice nurses, physician assistants, pediatric nurses, social workers, pharmacists, dietitians, child life specialists, mental health/behavioral health specialists, and other allied health professionals are among the multidisciplinary team members committed to the care of the child, adolescent, or young adult with cancer.

In the United States, the oncologic care of the child or adolescent with cancer should be directed by a pediatric hematologist/oncologist who is board certified in the subspecialty of pediatric hematology and oncology by the American Board of Pediatrics. Initial diagnostic assessment, induction therapy, and management of complications or

recurrences should be provided in a pediatric center that has the following personnel, facilities, and capabilities.

PERSONNEL

- Board-certified pediatric hematologists/oncologists
- Pediatric oncology nurses who are certified in chemotherapy, knowledgeable about pediatric protocols, and experienced in the management of complications of therapy; Association of Pediatric Hematology/Oncology Nurses certification is preferable
- Board-certified radiologists with specific expertise as evidenced by certification and training in the diagnostic imaging and radiologic intervention of infants, children, adolescents, and young adults
- Board-certified surgeons with expertise in pediatric general surgery
- Surgical specialists with pediatric expertise, as evidenced by certification and training in neurosurgery, urology, orthopedics, ophthalmology, otolaryngology, and gynecology
- Dentists who have completed additional training in pediatric dentistry
- A board-certified radiation oncologist trained and experienced in the treatment of infants, children, and adolescents
- Pathologists with special expertise as evidenced by certification and training in the pathology of hematologic malignancies, tumors of the central nervous system, and solid tumors in children, adolescents, and young adults
- Board-certified pediatric medical subspecialists available to participate actively in all areas of the care of the child with cancer, including anesthesiology, critical care, infectious diseases, cardiology, neurology, endocrinology and metabolism, genetics, gastroenterology, child and adolescent psychiatry, nephrology, palliative medicine, pulmonology, adolescent medicine, and behavioral and developmental specialists
- Pediatric physical and mental rehabilitation services, including pediatric physiatry and pediatric psychiatry
- Social worker(s) with experience in pediatric oncology, pediatric psychologists, child life specialists, and school reintegration specialists, and access to personnel skilled in providing family support and group services and chaplaincy personnel who provide spiritual support
- Experts with knowledge in complementary and alternative therapies
- Nutrition experts with experience in pediatrics and the capability of preparing, administering, and monitoring total parenteral nutrition
- Pharmacist(s) with experience and training in providing chemotherapy and supportive care medicines for pediatric patients with cancer; a board-certified clinical pharmacologist, where available, may be helpful in patient management
- Continued active involvement by the primary care pediatrician is important for the provision of patient- and family-centered supportive care

FACILITIES

- An immediately accessible and fully staffed, on-site PICU
- Up-to-date diagnostic imaging facilities to perform radiography, computed tomography, MRI, ultrasonography, radionuclide imaging, and angiography; positron-emission tomography scanning and other

emerging technologies are desirable

- Access to up-to-date radiation-therapy equipment with facilities for treating pediatric patients
- An established relationship with a hematopathology laboratory capable of performing cell-phenotype analysis using flow cytometry, immunohistochemistry, molecular diagnosis, cytogenetics, and polymerase chain reaction–based methodology and fluorescence in situ hybridization
- Access within the community to pediatric hemodialysis and/or hemofiltration and apheresis
- Appropriate isolation facilities for patients with severe immunosuppression, including high-efficiency particulate air (HEPA) filtration, or laminar flow rooms and positive/negative pressure rooms

CAPABILITIES

- A clinical chemistry laboratory with the capability to monitor antibiotic and antineoplastic drug concentrations
- A blood bank capable of providing a full range of products, including irradiated and leuko-depleted blood components
- A pharmacy capable of accurate, well-monitored preparation and dispensing of antineoplastic agents and investigational agents
- Access to stem cell transplant services with the capability or availability of HLA antigen typing
- Educational and training programs for health care professionals, including the primary care physician
- A regularly scheduled multidisciplinary care conference
- Care coordination of family-centered services including home health, pain management, palliative, and end-of-

life care and treatment plan compliance

- A regularly scheduled multidisciplinary pediatric tumor board
- Ability to function as the medical home incorporating anticipatory guidance as defined in Bright Futures for the child with cancer during active treatment; on completion of therapy, care may transition back to the primary care medical home with oversight by the cancer center's multidisciplinary team
- An established program designed to provide long-term, multidisciplinary follow-up of successfully treated patients at the original treatment center or by a physician-led team of health care professionals who are familiar with the potential adverse effects of treatment of childhood cancer; as survivors of childhood cancer move into adulthood, transition to an adult provider may be appropriate¹
- Membership or affiliation with a cooperative clinical trials group, such as Children's Oncology Group, to provide access to state-of-the-art clinical trials; availability of support for coordination to track patients' progress and maintain clinical trials data
- Full-time access to professional medical interpreters to ensure accurate translation and effective communication among all health care professionals and the patient and family; written materials should be available in the native language of the patient/family, and an ongoing program to deliver culturally effective care should be available
- A formal, ongoing program to continually assess and improve quality and safety including feedback from patients and families
- A formal program for cancer education for the patient, family, and/

or caregiver and instruction on self-management

- Access to instruction and learning activities for hospitalized children and adolescents

ROLE OF CENTERS IN DIAGNOSIS AND TREATMENT

More than 15 000 new cases of cancer are diagnosed in children younger than 20 years annually in the United States.^{2,3} Cancer is the second leading cause of death after accidents in children ages 5 to 14 years.

Great progress has been made in the development of successful treatment programs for children, adolescents, and young adults with cancer. These improvements have been possible because of the availability and collaboration of pediatric cancer treatment centers with collective expertise in the clinical management of children with cancer. Experienced investigators and allied health professionals recognize the importance of a national clinical trials network in developing more successful treatment strategies.⁴

The importance of comprehensive, multidisciplinary treatment in improving patient outcome in a cost-effective manner has been well documented for children with acute lymphoblastic leukemia,⁵ non-Hodgkin's lymphoma,^{6,7} brain tumors,⁸ rhabdomyosarcoma,^{6,8} Wilms tumor,⁹ and Ewing sarcoma.⁶ Almost 80% of these children can be treated successfully if modern diagnostic and therapeutic approaches are initiated expeditiously.³ Accurate diagnosis, appropriate treatment, and supportive care depend on a multidisciplinary treatment approach to children, adolescents, and young adults with cancer, an approach that is uniquely available at a pediatric cancer center. The roles of specialized nursing, pharmacy, rehabilitation, and paramedical personnel and access to increasingly complex equipment and

facilities are critical to further improving long-term survival and quality of life.

The center-based pediatric hematologist/oncologist directs the diagnostic evaluation and treatment of most children, adolescents, and young adults with cancer. Pediatric hematology/oncology is an established specialty with specific training requirements that lead to subspecialty board eligibility. Because most pediatric tumors show a striking response to specific regimens of intensive chemotherapy, pediatric hematologists/oncologists use therapies that can have substantial morbidity and potential mortality. For these therapies to be administered safely, a pediatric hematologist/oncologist who is trained and experienced in the management of children, adolescents, and young adults with cancer and who has extensive knowledge of the relevant drug indications and toxicities must oversee the care of these patients.

The pediatric hematologist/oncologist must be assisted by skilled nurses, social workers, pharmacists, nutritionists, and psychologists who specialize in pediatric oncology. Professional organizations such as the Association of Pediatric Hematology/Oncology Nurses and the Association of Pediatric Oncology Social Workers facilitate the professional growth and education of nurses and social workers. Diagnostic radiologists and radiation oncologists with specific training and interest in pediatric oncology should be available at the pediatric cancer center. Principles of surgery that are unique to childhood tumors have evolved in fields such as general (pediatric) surgery, urology, neurosurgery, and orthopedics. The presence of surgeons with demonstrated expertise in the surgical aspects of pediatric oncology has become indispensable in achieving maximum survival. A pathologist experienced in pediatric

oncology is an essential member of the multidisciplinary team at the pediatric cancer center. State-of-the-art diagnosis of many pediatric hematologic malignancies and tumors requires immunochemistry and/or molecular techniques. Because solid tumors in children, adolescents, and young adults are rare in the experience of most pathologists, an incorrect histologic diagnosis may be given when initial surgical management occurs at a non-specialized hospital. Ideally, the diagnostic biopsy should be performed at the pediatric cancer center, at which the facilities are available to order and obtain all the special studies that would be appropriate, reducing the need for repeat procedures.

PRACTICE OF PEDIATRIC ONCOLOGY OUTSIDE RECOGNIZED CENTERS

Clinical results in children with cancer have been shown to be superior when specialized diagnostic testing, supportive care, and initial cancer treatment are carried out at a pediatric cancer center.⁵⁻⁹ After diagnosis has been established and the treatment plan has been determined by the pediatric cancer center, certain aspects of care that are not investigational may be continued in the office of a primary care pediatrician for selected children when mandated by distance from the cancer center or other individual specific circumstances. In some circumstances, communication via telemedicine may be beneficial. When such a plan for shared treatment is

undertaken, it must be a collaborative effort between the pediatric cancer center and the primary pediatrician, with ongoing communication between the local and distant site. For many children, the facilities and expertise available at the pediatric cancer center are required for all aspects of therapy. However, it must be emphasized that the primary care pediatrician should retain an important supportive role for the patient with cancer and his or her family, which requires excellent regular communication between the oncologist and the pediatrician. Most of a patient with cancer's course is spent at home under the care of family members and the primary care physician. The role of families in the decision-making, care, and advocacy for the child is critical. Hematology/oncology team members must be available, responsive, and versed in discussing supportive care provided away from the tertiary center.

SUMMARY

On the basis of the effectiveness of pediatric cancer centers in treating children, adolescents, and young adults with cancer, the American Academy of Pediatrics recommends the following:

- Children, adolescents, and young adults with newly suspected and/or recurrent malignancies should be referred to a pediatric cancer center for prompt and accurate diagnosis and management. Centers that are unable to accept the referral should arrange for the child

to be seen promptly at another appropriate facility.

- Children and adolescents with newly diagnosed and/or recurrent malignancies should have their treatment coordinated by a board-certified pediatric hematologist/oncologist. Treatment should be prescribed and initiated at a pediatric cancer center, but therapy that is not investigational may be continued at a center not specialized in the care of the pediatric oncology patient. Care should be delivered with the oversight of the pediatric cancer center's multidisciplinary team.
- Multidisciplinary team members should be physician led and have pediatric expertise within their specialty area.

CLINICAL REPORT

Testing for Drugs of Abuse in Children and Adolescents

abstract

FREE

Drug testing is often used as part of an assessment for substance use in children and adolescents. However, the indications for drug testing and guidance on how to use this procedure effectively are not clear. The complexity and invasiveness of the procedure and limitations to the information derived from drug testing all affect its utility. The objective of this clinical report is to provide guidance to pediatricians and other clinicians on the efficacy and efficient use of drug testing on the basis of a review of the nascent scientific literature, policy guidelines, and published clinical recommendations. *Pediatrics* 2014;133:e1798–e1807

INTRODUCTION

The recreational use of drugs is an underrecognized cause of mortality and morbidity in children and adolescents. It is, in fact, a public health priority.¹ Although annual surveys of drug use by children and adolescents may show fluctuation, the underlying rates remain high.² Numerous adverse consequences accompany use, not the least of which is the increased risk of dependence among those who began smoking, drinking, and using drugs before 18 years of age.^{3,4} Furthermore, most adults with substance use disorders initiated use during childhood or adolescence.⁵ Pediatricians are on the front lines for deterring, delaying, detecting, and diminishing the use of drugs by children. It is imperative that all pediatricians understand and are ready to use the tools and strategies effective for these endeavors.

Drug testing has been recommended in a variety of settings and clinical situations to avert substance use, to identify use as part of an assessment, or as part of treatment of individuals with substance use disorders. To date, there is little consensus among physicians regarding the indications for drug testing and little guidance on how to use this procedure effectively for any indication.⁶ The federal government has issued extensive guidance on the use of urine drug testing with federal and other employees,⁷ although this guidance is not applicable for all situations and age groups. Experts have called for further evidence-based studies to guide best practices with adolescents.⁸

The complexity and invasiveness of the procedure and limitations to the information derived from drug testing all affect its utility. The objective of this clinical report is to provide guidance on the efficacy and efficient use of drug testing on the basis of a review of the nascent scientific literature, policy guidelines, and published clinical recommendations.

SPECIMEN TYPES

Six biological matrices are commonly used for drug assays: urine, blood, breath, saliva, sweat, and hair. Neonates may also be tested using meconium. The choice of sample is influenced by the cost, ease of sample collection, risk of adulteration, test type (instant or laboratory based), scope of drugs being tested, time frame (acute or chronic use), time since last use, and indications for testing. Practices and laboratories should only conduct tests for which they are certified by the Clinical Laboratory Improvement Amendments.

Breath testing is mainly used by law enforcement and alcohol treatment programs for detection of recent alcohol use; it is not, however, routinely used in primary care. It is an easy-to-use, non-invasive test that is considered a good proxy for blood alcohol concentrations; urine alcohol concentrations, on the other hand, do not correlate well with blood alcohol concentrations or corresponding central nervous system impairment. Alcohol mouthwash or breath sprays used immediately before testing may result in false-positive test results.

Carbon monoxide and a nicotine metabolite known as cotinine are the 2 products in tobacco that are used for screening. Carbon monoxide can be measured in the breath up to 24 to 48 hours after smoking and then falls to nonsmoker levels. Cotinine is regarded as the best biomarker of tobacco exposure because it has a long half-life and can be measured in blood, saliva, hair, and urine.^{9,10}

Blood concentrations are most useful for detecting alcohol and other drug use that occurred within 2 to 12 hours of the test and are best correlated with the level of impairment and morbidity seen in emergency situations. Blood testing is costly because of the need for specially trained personnel and equipment and is intrusive. Because of these

drawbacks, blood testing is rarely used in the primary care setting.

Saliva (oral fluid) and sweat testing provide similar information to blood testing but are less invasive and do not require extensive training for sample collection. Saliva allows for detection of drug excreted from the blood after recent use (ie, within 24–48 hours) that may not yet be detectable in urine. It is less subject to contamination than urine; smoking and methods used to stimulate saliva production to increase specimen volume may affect the results. Therefore, this method requires patient supervision in the 30 minutes before sampling.¹¹ Point-of-care tests are available for saliva testing.¹²

Sweat may be used to detect drug use in 2 ways. First is a patch that is worn from 3 to 7 days and detects drug use that occurred just before the patch was applied (most drugs will be excreted within 48 hours) and drug use that occurs while the patch is in place. Second, a swipe may detect drug use within the past 24 hours (collection device not approved by the US Food and Drug Administration). The collection is noninvasive and has a similar cost to urine. Although difficult, environmental contamination can occur and lead to false-positive results.¹³ Specimen volume may be affected both by the patient's sweat secretion rates or removal of the patch during the collection period. The sample size obtained with oral fluid and sweat patch tests limits the ability to repeat tests and perform confirmatory testing. Both saliva and sweat assays are less standardized than urine or blood tests, and the accuracy of sweat testing remains controversial.^{14–16}

Hair testing allows for detection of past use that has occurred over an extended time because drugs and metabolites are incorporated into the hair matrix over time. Hair cannot be used for detection of use in the pre-

vious 7 to 10 days. It is most reliable for heavy, frequent past use and not for detection of recent or occasional drug use. The hair needs to be cut as close to the scalp as possible, and usually the first 3 cm is used for testing, which covers a 90-day period (hair grows 1 cm a month). If longer hair is sent, the laboratory will cut it into segments before testing, and 4 tests will allow for screening over a period of a year. If the scalp is shaved, hair from other body areas may be sent instead. However, hair grows at a slower rate on the body, and a time frame cannot be used in this circumstance. Hair collection can be directly observed and is non-invasive, hair is easily stored and transported, and adulteration and substitution is difficult. However, hair testing is not useful clinically, because it has a long window of detection. In addition, hair structure, growth rate, melanin content, hygiene, and cosmetic treatment can affect the results. Drug concentrations in hair can be altered by shampoos, bleaches, or dyes, and false-positive results may be obtained with volatile drugs such as marijuana, which may adhere to hair.^{17,18} No point-of-care tests are available; laboratory testing is costly, and it takes a long time to obtain results.

Urine testing is invasive and highly susceptible to tampering. Nonetheless, because it is well standardized and studied, less invasive than blood testing, and provides a longer window of detection for some substances, it is the most common sample used for drug testing in primary care. A physician survey⁶ found that >90% of pediatrician and family physician respondents had used urine testing with adolescent patients in their office, suggesting that the practice is quite common. In the remainder of this report, “drug testing” will refer to urine drug testing unless otherwise indicated.

URINE DRUG TESTS

Two types of drug testing assays are available: qualitative tests usually used for screening and quantitative tests used for confirmation. Qualitative tests are point-of-care tests and home drug test kits. They are easy to perform, relatively inexpensive, and use immunoassays, such as enzyme-linked immunoassay or radioimmunoassay, that give instant positive or negative results. Although they are sensitive and function well as screening tests, they are susceptible to cross-reactions, resulting in false-positive results, which limit their specificity. Some laboratories use qualitative tests as a "screening procedure"; in this method, negative test results are discarded, and only positive test results are run through more expensive confirmatory testing, although the 2-step procedure has become less common as the cost of confirmatory testing has decreased. Confirmatory tests are performed in laboratories and not at the point of care. Most laboratories use a combination of gas chromatography and mass spectrometry and can positively identify a substance and generate quantitative concentrations.

INDICATIONS FOR DRUG TESTING

The illicit and often secretive nature of substance use may result in adolescents being unwilling to give accurate information about their substance use, and thus drug testing may yield important information, as in the various situations discussed below.

Emergent Clinical Care

Drug testing may identify possible toxins when a patient presents with altered mental status. In truly emergent situations, consent may be inferred, and testing should be considered in accident victims, after a suicide attempt, for unexplained

seizures, for syncope or arrhythmias, or in the presence of toxidromal signs and symptoms that render the patient incapable of informed consent. In the case of a toxidrome, physical findings should guide the clinician to test for a specific panel of substances, even with minimal or no history available. A positive test result for a substance suspected on the basis of clinical findings is less likely to be a false-positive or spurious result because of the higher pretest probability in this setting. However, drug testing has significant limitations, even in the emergency setting. Standard laboratory tests detect drug metabolites with an unreliable frequency and often have reference ranges far lower than therapeutic dosages; thus, they may identify substances that are present but not causing the observed symptoms. Emergency management of an obtunded patient, such as the decision to give naloxone, is made on clinical grounds and not on the basis of results of a laboratory test. Nonetheless, the results of a drug test may be helpful in determining management once the patient is stabilized.¹⁹

Assessment of Behavioral or Mental Health Symptoms

Drug use by teenagers often presents to medical attention with nonspecific signs and symptoms (such as fatigue, excessive moodiness, school failure) and, as such, may be hard to diagnose definitively. Voluntary drug testing may be a useful part of an assessment when a parent, clinician, or other adult suspects recent or ongoing drug use on the basis of observed symptoms. Like any other laboratory procedure, drug testing should be an adjunct to a thorough history rather than a replacement. In cases in which an adolescent denies use, a positive drug test result may afford an opportunity to begin an honest conversation. Drug testing may be unnecessary if a patient

is forthcoming regarding his or her drug use history. Unfortunately, significant limitations to laboratory drug testing limit the information garnered from the procedure (see "Sources of Error in Interpreting Urine Drug Tests"). Like any other laboratory test, drug test results must always be interpreted within the context of history, including both collateral and self-reports when possible.

THERAPY AND MONITORING

Drug testing programs that use contingency management strategies may be an effective therapeutic adjuvant for patients with substance use problems or disorders.^{20,21} Patients typically receive either positive reinforcement, such as cash rewards or small gifts, when a drug test result is negative or negative consequences when a drug test result indicates ongoing drug use.²² Research has consistently demonstrated the efficacy of these programs among adults, and emerging research suggests that drug testing is acceptable and effective with adolescents and young adults participating in drug abuse treatment programs.²³ Drug testing is also frequently used as a deterrent for juveniles in the probation system. Juvenile drug courts, which include frequent drug testing, have been shown to decrease substance use more so than traditional family courts. It has been suggested that even in the absence of additional therapies, the monitoring function of testing can be an effective discouragement from use.^{24,25} The effective drug testing programs that have been described in the literature are relatively expensive, are staff intensive, and may not be well suited for primary care. Engaging parents and supporting them in implementing appropriate contingencies could decrease the overall expenses of such

a program; when appropriate, parental monitoring may also serve as a contingency, with negative results intrinsically rewarding. One study found that a drug-testing program in which parents received test results from the physician would be acceptable to adolescents,²⁶ although to date, no study has demonstrated the effectiveness of such an approach.

SCREENING

A national survey of physicians found that few respondents use “suspicionless” drug testing as a means of screening for drug use in the medical home,⁶ and most experts agree that drug tests are not a useful screening procedure for general clinical populations because their sensitivity for detecting drug use in unselected populations is low.^{27,28} However, home-, school-, or employment-based programs may include a screening component (ie, unselected or general populations may be tested) to detect or deter drug use. Participant consent should be required for all of these programs, as it would be in a clinical setting.

Results of studies of school-based drug testing programs are mixed: drug testing has poor sensitivity for detecting drug use, although some studies have found a deterrent effect. The American Academy of Pediatrics (AAP) does not endorse widespread implementation of school-based drug testing because of the limited efficacy, its cost, and the potential for unintended effects, such as breach of confidentiality. School-based drug testing is discussed in greater detail in a separate AAP statement.²⁹

HOME DRUG TESTING

Drug tests have been commercially available and marketed to parents to prevent adolescent drug use for the

past 15 years. Marketing Web sites often include “home drug testing policies” that recommend drug testing on either a routine basis to prevent drug use or when a parent has specific concerns.³⁰ Home drug testing has been endorsed by several school districts and police departments around the country. To date, the efficacy of home drug testing for reducing substance use by adolescents has not been rigorously tested. The AAP does not endorse home drug testing because of concerns about the complexity of testing with significant potential for parents to misinterpret test results, limited evidence that home drug testing reduces drug use, and theoretical concerns about a negative effect on the relationship between parents and their children. A professional evaluation should be considered whenever a parent has concerns about substance use.³¹

SCHOOL CLEARANCE

Some schools require “medical clearance,” including a negative drug test result, before readmitting a student who has been suspended for drug use or possession. In these cases, the AAP suggests that the pediatrician conduct a thorough history to understand the student’s level of drug involvement. Although there are no specific guidelines for “medical clearance,” the AAP suggests that students who have been caught with drugs or paraphernalia or who were impaired at school should be allowed to return to school (after disciplinary consequences set by the school). At the conclusion of a medical evaluation, it is important to include a plan for follow-up and/or treatment in addition to considering a return to school, unless assessment suggests a serious substance use disorder requiring a more restrictive treatment setting, in which case the adolescent should be referred. The AAP cautions that “clearance” has no

uniformly accepted definition in the medical or legal literature; various individuals, such as parents, teachers, and school administrators may have different interpretations of clearance than do pediatricians. Pediatricians could, therefore, report the following as appropriate: (1) the student has received an appropriate medical evaluation and (2) reasonable medical standards indicate that return to school is a reasonable option. Furthermore, parents must consider their adolescent’s individual risks and benefits while continuing to monitor their adolescent’s behaviors.

A drug test may be particularly useful for adolescents who report limited or infrequent drug use. In these cases, a negative test result would be expected and would support the adolescent’s history. A brief period of monitoring with random tests may further support the student’s history of limited use. Adolescents who report heavy use, particularly of marijuana, are likely to have a positive drug test result even several days to weeks after termination of use. In these cases, a period of monitoring until a negative test result is obtained may be useful, although the AAP suggests that the adolescent return to school while awaiting a negative test result. Quantitative tetrahydrocannabinol (THC) concentrations may be followed to distinguish between prolonged excretion and ongoing drug use. These levels should be corrected for urine concentration to improve accuracy; one common method is to calculate a THC-to-urine creatinine ratio.³²

A student or parent may refuse a drug test and instead accept the school’s consequences or fight them. There is little legal precedent with regard to whether a school has the right to insist on a drug test from an individual student in this situation; however, 2 Supreme Court decisions both supported

a school's right to require drug testing for students who participate in sports or other extracurricular activities.^{33,34} The AAP suggests that the pediatrician advise the student and family in this situation to submit to a drug test and then advocate for returning to school as outlined previously, although ultimately, the student and his or her parent determine how to proceed.

SOURCES OF ERROR IN INTERPRETING URINE DRUG TESTS

False-Positive Results

Like any medical laboratory test, drug testing can yield false-positive or false-negative results. In urine drug testing, a "clinical" false-positive result (ie, drug detection in the absence of illicit drug use) is more likely to occur on a screening test because of cross-reactivity with an unrelated substance in the urine. For example, fluoroquinolone antibiotics have been reported to cross-react with immunoassay opiate screens.^{35,36} Confirmatory tests are highly unlikely to yield false-positive results but can yield a "clinical false-positive" result when a patient takes a certain prescription medication or ingests a food that metabolizes into a substance included in the drug testing panel. For example, a patient taking amphetamine and dextroamphetamine for attention-deficit/hyperactivity disorder will have a positive test result for amphetamines, which may be falsely positive for substance abuse. Unfortunately, drug testing cannot distinguish between appropriate use and misuse of prescribed medications. To interpret drug test results accurately, it is necessary to know an individual's complete medical history, including prescribed medications. In addition, the practitioner needs to know the limitations of the selected matrix, the substances for which the drug panel tests, and potential cross-reactivity. The practitioner should not

hesitate to ask for assistance in ordering the correct test or interpreting results.

False-Negative Results

A negative drug test result does not necessarily mean that an adolescent is not using a particular substance. The urine specimen submitted may not be a valid sample, as when an adolescent attempts to evade a positive test by submitting someone else's urine, dilutes his or her own urine, or adds an adulterating (or "masking") agent to the sample to interfere with the screening immunoassay (eg, soap, bleach, ammonia). Even in the absence of adulteration, use may escape detection because of the timing of use relative to the testing, or if the cutoff concentration for a positive test result is set too high, small amounts of drug or metabolite may be missed. Another example occurs when the psychoactive substance used is not part of the standard test panel, resulting in a "clinical false-negative" test result (eg, "spice" and newer designer drugs). Test panels often use a common metabolite to identify an entire class of substances (see Table 1). However, individual substances with variant metabolism can still be missed. For example, benzodiazepine panels that identify oxazepam will not identify clonazepam, which is commonly misused by adolescents but not metabolized through this pathway. Thus, interpreting drug test results can be exquisitely complex, even for experienced clinicians, and should be done with caution. Seeking assistance from the testing laboratory is important, particularly when test results do not correlate with clinical findings and when a physician suspects the use of a particular substance that is not included in a test panel.

URINE SPECIMEN COLLECTION

An accurate test result is dependent on obtaining a proper specimen. Direct observation is the most reliable

method for specimen collection. It is recommended that each treatment facility have a protocol in place that describes how urine specimens intended for drug testing will be collected from both male and female patients. It is also recommended that random specimens or those taken without supervision be labeled as such. Specimens that may have pertinence to a legal matter (eg, those taken after a motor vehicle crash or as part of a court-ordered program) may require collection in a tamper-proof container and also require chain of custody. When this is not practical, the patient should be referred to a laboratory facility that has this capability.

A less-invasive collection method involves excluding coats and bags and using a specially prepared restroom without running water, soap, or other chemicals. Toilet water should be tinted. The specimen's appearance and color should be documented and the temperature should be taken within 4 minutes, preferably by use of a collection container with a temperature-sensitive strip on the outside. The temperature should be recorded within 4 minutes of collection and should range from 90°F to 100°F (32°–38°C). The procedure should be explained to the patient before any collection. A national survey of physician practices found that most offices use none of these procedures (although many provide a staff member outside the door to listen for running water).³⁷ If unsupervised collection is used, results should be interpreted with caution.

Modesty

In all cases, the need to obtain information from a drug test must be balanced with protecting an adolescent's dignity. If a reasonable balance cannot be attained, the pediatrician might consider forgoing a drug test and basing

TABLE 1 Approximate Duration of Detectability and Common Cutoffs for Selected Drugs

Drug	Metabolite	Window of Detection	Comments
Alcohol	Alcohol	7–12 h	Ethyl succinate and ethyl glucuronide can persist in the urine up to 5 d after heavy alcohol use. However, use of hand sanitizer, mouthwash, cough syrup, etc, can result in low levels without “alcohol use.”
	Ethyl succinate, ethyl glucuronide	Up to 5 d	
Amphetamines			Note that methylphenidate is not detected on a routine amphetamine panel; therefore, a positive amphetamine test result cannot be explained by use of a methylphenidate preparation.
Amphetamine (AMP)	MAMP	1–3 d	
Methamphetamine (MAMP)	>100 ng/mL of AMP+MAMP	1–2 d	
3,4-MethylenedioxyAMP	MDA	1–2 d	
3,4-MethylenedioxyMAMP	MDMA	1–2 d	
Barbiturates			
Pento/secobarbital	Secobarbital	Short-acting, 4–6 d	
Butalbital	Secobarbital	Intermediate, 3–8 d	
Phenobarbital	Secobarbital	Long-acting, 10–30 d	
Benzodiazepines			Most benzodiazepine screens identify oxazepam and will not pick up all benzodiazepines. If evaluating a patient for benzodiazepine use, it is important to find the specific drug on the test panel or speak with the laboratory personnel.
Triazolam	Hydroxyethyl flurazepam	Short-acting, 1 d	
Clonazepam	7-amino Clonazepam	Intermediate, 1–12.5 d	
Diazepam	Oxazepam	Long-acting, 5–8 d	
Chronic use		Can last 30 d after last use	
Cocaine	Benzoylcegonine	1–3 d	Note that synthetic cannabinoids will not be picked up on a cannabinoid screen. If use of synthetic cannabinoids is suspected, speak to the laboratory regarding availability of tests for these substances.
Cannabinoids	Carboxy-THC	Single use, 1–3 d	
		Moderate use, 4 d; heavy use, 10 d	
		Chronic, 3–5 wk after last use	
		4 h	
Lysergic acid diethylamide (LSD)	Nor-LSD		
Methadone	Methadone and metabolite 2-ethylidene-1,5-dimethyl-3,3-diphenylpyrrolidine	1 d–1 wk	
Opiates			
Morphine (M)	Morphine	1–2 d	
Codeine (C)	Morphine and codeine	1–2 d	
Semisynthetic opiates	Hydrocodone	1–2 d	
	Hydromorphone	1–2 d	
	Oxycodone	1–3 d	
	Oxymorphone	1.5–2.5 d	
Heroin	6-acetyl-morphine +morphine	<24 h up to 1–2 d	6-acetyl-morphine is pathognomonic for heroin use but has a narrow time window and is most often not detected on a drug test. A test that is positive for morphine outside of the use of prescribed morphine is suggestive of heroin use.
Phencyclidine (PCP)	Phencyclidine	Casual use, 2–10 d Chronic use, several weeks	

clinical decisions on history and physical examination alone. This may include referring a patient for further evaluation or treatment on the basis of a high index of suspicion of drug use. Signs and symptoms of a mental health, behavioral, or substance use disorder

should not be discounted because of inability to obtain a drug test.

CONFIDENTIALITY

Many national organizations, including the AAP, have consistently cautioned

against involuntary drug testing in adolescents.³¹ Adolescents should be engaged in their own care and, in most states, can consent to substance abuse treatment on their own.^{38,39} Drug testing of a competent adolescent without his or her consent is, at best, impractical

and without his or her knowledge is unethical and illegal. However, an adolescent's refusal to consent to a drug test should not prematurely conclude an evaluation of a substance use problem or disorder. If a pediatrician suspects that an adolescent is using drugs and that adolescent is refusing a drug test, his or her refusal should be documented, and referral to an addiction or mental health specialist is warranted. Pediatricians may also coach parents on appropriate limit setting or discipline. For example, a parent may suspend driving privileges if there is suspicion that an adolescent is using psychoactive substances; privileges may be restored if the teenager can reasonably demonstrate that he or she is not using substances.

Adults who have a long-term relationship with an adolescent are often aware of early behavioral, mental health, and physical changes that may prompt the request for drug testing. Before drug testing, the pediatrician should get a detailed description of the concerns to formulate a differential diagnosis and determine whether a drug test may be a helpful part of an assessment. If so, a discussion about the limited scope of information available from testing as well as the need to reach a consensus on an action plan for both positive and negative results should be undertaken. This will make any intervention easier to implement. The concerns raised by the adult and the recommendation for a drug test should then be discussed with the adolescent, and assent, including permission to share results, should be obtained before testing. If an adolescent refuses to consent to sharing the drug test results with a parent then they should not be shared. If the drug test was requested by the parents, the pediatrician should explain to them that their son or daughter has not consented to release

drug test results. However, as in all situations, if an adolescent's behavior puts him or her at acute risk of harm to self or others, the pediatrician should consider breaching confidentiality.

MANAGEMENT

Ideally, drug test results may reassure parents or lead to an honest conversation about drug use that can guide further intervention. Unfortunately, if managed poorly, drug test results may be contentious, cause friction between an adolescent and his or her parents, and create a difficult situation for the clinician to manage. The AAP believes good outcomes are more likely if the pediatrician reviews how test results will be managed *before* a test is sent to the laboratory.

In most instances in which a drug test is ordered for an adolescent patient, parents will want to know the results, and with few exceptions, sharing drug test results with parents is a helpful part of the process of drug testing. One exception would be a treatment-seeking adolescent who does not want to inform parents, and testing is used as a form of therapy. This situation is rare in primary care, but if encountered, the pediatrician should respect the engaged adolescent's autonomy. Adolescents younger than 18 years are able to consent to substance use treatment without parental consent in more than half of the United States. It is important for the practitioner to learn about laws governing confidentiality in the states in which they practice.

Positive Test Results

Because drug tests may yield false-positive test results, we suggest that the clinician always review positive results first with the adolescent to determine whether something other than substance misuse may explain the observed results. The

pediatrician should consider both the laboratory results and the history before assessing the likelihood of substance use and presenting information back to parents.

The pediatrician may begin the interaction by informing the adolescent that the drug test gave unexpected results (which could refer to a test interpreted by the physician as positive, dilute, or adulterated) and asking for more information. In some instances, the adolescent may report substances not detected on the panel, ultimately yielding more information than the test results alone conveyed. If the adolescent's report matches the drug test results, the pediatrician can begin a conversation about the next steps, which may include an abstinence trial, ongoing testing, and/or a referral to counseling or other treatment. If reports of drug use match the results of a point-of-care test, confirmatory testing, which adds considerable expense, could reasonably be omitted.

If an adolescent denies substance use despite a positive drug test result without a reasonable alternative explanation, the pediatrician can present available information to parents (assuming consent has been obtained). Laboratory testing is not perfect, and spurious results are possible. Repeat drug testing may be of value; adolescents with serious drug disorders are likely to ultimately have multiple positive drug test results.

Negative Test Results

A negative drug test result can support a history of no recent drug use and may be reassuring to parents and pediatrician. However, the pediatrician should not dismiss ongoing behavioral or mental health symptoms just because a drug test result is negative. Rather, a referral for a more in-depth mental

health evaluation is warranted in such cases.

A single negative drug test result does not exclude the possibility of drug use or a substance use disorder. If a substance use disorder is highly suspected on a clinical basis, the pediatrician should consider the possibility of a substituted, adulterated, or diluted sample; use of a substance not detected by the test panel; or a missed window of detection. If one of these conditions is suspected, other testing considerations include repeating the urine test serially, using a different matrix, changing the method (eg, to laboratory testing if a point-of-care test was used), adding specimen validity testing, or changing/adding to the test panel. In addition, the pediatrician should consider referral to an addiction or mental health specialist for further evaluation. Paradoxically, a “falsely” negative drug test result (ie, a test result that is negative despite ongoing drug use) might inadvertently delay detection and treatment of a substance use disorder if symptoms are dismissed and further evaluation is not pursued.

Dilute Specimens

All urine drug test orders should include a check for specimen integrity. Creatinine, which is a product of muscle metabolism, is used as a marker of urine concentration and should be ordered with each sample. Urine samples with a random creatinine concentration between 2 and 20 mg/mL should be considered dilute. Some of these samples may be positive for one or more 1 substances and should be considered both positive *and* dilute because it is possible to miss substances present in lower concentrations (eg, a urine specimen may test positive for marijuana

but be too dilute to identify low levels of cocaine).

Dilute specimens present a difficult clinical challenge in interpreting drug test results. Smaller adolescents or those with less muscle mass are more likely to have lower random urine creatinine concentrations. Adolescents may consume a large volume of fluid before the test either spuriously to be able to produce a urine specimen rapidly, or intentionally to attempt to defeat the test. These different scenarios cannot be distinguished on the basis of drug test results alone, and clinical correlation is warranted. In these cases, a repeat drug test may also be helpful. First-morning specimens generally result in samples with adequate concentration. If a first-morning specimen is not possible, the adolescent can limit fluid intake in the few hours before providing a specimen.

Substituted or Adulterated Specimens

Urine specimens that have been substituted or adulterated in vitro should always be considered “positive” and may represent a serious substance use disorder and/or co-occurring mental health or behavioral disorder. In these cases, referral to an addiction specialist or mental health expert is warranted. Substituted specimens may be cold, may have a urine creatinine concentration ≤ 2 mg/mL, or may be found in the adolescent’s possessions. Adulterated specimens may have an unusual color or smell, may have out-of-range pH, or may result in a positive “adulterant panel” (available from some commercial laboratories). In these cases, if drug testing is to be repeated, observed urine collection may reduce the opportunity to tamper with the specimen.

Managing Confidentiality Between Patients and Outside Entities

Care should be taken to protect all information about substance use, including historical reports and drug test results that are recorded in the medical record. In primary care, the Health Insurance Protection and Accountability Act of 1996 (Pub L No. 104-191) stipulates how all medical records must be protected and can only be released via signed informed consent or other legally authorized means. For care provided in a substance abuse treatment program, federal substance abuse confidentiality regulations (CFR 42 Part 2) supersede the Act and provide even more stringent criteria for release of information (the form must designate the specific information to be released).

Before releasing any information to any outside entity, the AAP recommends that the clinician consider potential advantages and risks of doing so. Pediatricians often have an opportunity to play the role of an intermediary between schools, probation officers, or other organizations and their adolescent patients, and having information pass through the pediatrician can offer a number of advantages. For example, the pediatrician can interview the adolescent and parent to help interpret drug test results before releasing information from the laboratory. In the case of a true positive result indicating recent drug use, the pediatrician can discuss a plan for monitoring and/or treatment that can be provided along with the drug test results. The recipient of the information will likely appreciate expert advice on level of care, and this type of input may help to prevent consequences such as school expulsion or custody for probation violations and instead direct adolescents into appropriate care for substance use disorders. Ultimately, however, patients, in conjunction with parents, decide to whom drug testing and other information may be released.

SUMMARY

Drug testing is a complex procedure that, when used properly, may have a number of clinical indications. However, drug testing also has a number of drawbacks; it can be invasive, it yields only limited information, and results are easily misinterpreted. Drug testing should never be the sole basis for making a diagnosis of a substance use disorder; rather, test results should be used to supplement information obtained by history and physical examination. Signs and symptoms of

a mental health, behavioral, or substance use disorder should not be dismissed solely on the basis of a negative drug test result or inability to obtain a test; these symptoms always require further evaluation, and referral to a specialist should be considered.

All authors have filed conflict of interest statements with the American Academy of Pediatrics. Any conflicts have been resolved through a process approved by the Board of Directors. The American Academy of Pediatrics has neither solicited nor accepted any commercial involvement in the development of the content of this publication.

Policy statements from the American Academy of Pediatrics benefit from expertise and resources of liaisons and internal (AAP) and external reviewers. However, policy statements from the American Academy of Pediatrics may not reflect the views of the liaisons or the organizations or government agencies that they represent.

The guidance in this statement does not indicate an exclusive course of treatment or serve as a standard of medical care. Variations, taking into account individual circumstances, may be appropriate.

All policy statements from the American Academy of Pediatrics automatically expire 5 years after publication unless reaffirmed, revised, or retired at or before that time.

(Continued on last page)

abstract

FREE

Palivizumab was licensed in June 1998 by the Food and Drug Administration for the reduction of serious lower respiratory tract infection caused by respiratory syncytial virus (RSV) in children at increased risk of severe disease. Since that time, the American Academy of Pediatrics has updated its guidance for the use of palivizumab 4 times as additional data became available to provide a better understanding of infants and young children at greatest risk of hospitalization attributable to RSV infection. The updated recommendations in this policy statement reflect new information regarding the seasonality of RSV circulation, palivizumab pharmacokinetics, the changing incidence of bronchiolitis hospitalizations, the effect of gestational age and other risk factors on RSV hospitalization rates, the mortality of children hospitalized with RSV infection, the effect of prophylaxis on wheezing, and palivizumab-resistant RSV isolates. This policy statement updates and replaces the recommendations found in the 2012 *Red Book. Pediatrics* 2014;134:415–420

Policy statements from the American Academy of Pediatrics (AAP) are designed to provide updated guidance for child health care topics, with an emphasis on evidence-based recommendations whenever possible. Policy statements are reviewed at least every 3 years and updated when appropriate. In following this procedure, the AAP Committee on Infectious Diseases (COID) has undertaken a systematic review of all recent and older peer-reviewed literature relating to the burden of respiratory syncytial virus (RSV) disease in infants and children, focusing on publications that delineate children at greatest risk of serious RSV disease and studies that define pharmacokinetics, safety, and efficacy. Detailed input regarding this guidance has been solicited from 21 committees, councils, sections, and advisory groups within the AAP, as well as organizations outside the AAP. Outside groups include the American College of Chest Physicians, American College of Emergency Physicians, American Thoracic Society, Emergency Nurses Association, National Association of Neonatal Nurses, National Association of Neonatal Nurse Practitioners, and Society of Hospital

Medicine. In addition, this review includes all data presented to the COID by the manufacturer of palivizumab.

As part of this deliberative review of palivizumab use, the COID judged the quality of the available data, as well as the impact of palivizumab prophylaxis to reach a unanimous consensus on guidance for the use of palivizumab in the United States. Cost was considered during deliberations by the COID and Bronchiolitis Guideline Committee, but the final guidance as presented here is driven by the limited clinical benefit derived from palivizumab prophylaxis.^{1–3}

As detailed in the accompanying technical report,⁴ the benefit resulting from this drug is limited. Palivizumab prophylaxis has limited effect on RSV hospitalizations on a population basis, no measurable effect on mortality, and a minimal effect on subsequent wheezing.

This policy statement updates and replaces the most recent AAP recommendations for the use of palivizumab prophylaxis published in 2012 in the 29th edition of the *Red Book*.⁵ This policy statement offers specific guidance for the use of palivizumab on the basis of available evidence, as well as expert opinion. A detailed discussion of the foundation of the updated guidance for each category as well as the references for each section may be found in the accompanying technical report,⁴ and AAP guidelines for the diagnosis and management of bronchiolitis, which were published in 2006⁶ (for which a revision is forthcoming).

The palivizumab package insert states: “Synagis is indicated for the prevention of serious lower respiratory tract disease caused by RSV in children at high risk of RSV disease.”⁷ In the absence of a specific definition of “high risk” by the US Food and Drug Administration, the AAP has endeavored to provide pediatricians and other health care providers with more

precise guidance for determining who is at increased risk since palivizumab was first licensed.^{5,8–11}

The informed opinion of the COID and the Bronchiolitis Guidelines Committee, as well as others participating in the current statement, is that palivizumab use should be restricted to the populations detailed below.

PRETERM INFANTS WITHOUT CHRONIC LUNG DISEASE OF PREMATURITY OR CONGENITAL HEART DISEASE

Palivizumab prophylaxis may be administered to infants born before 29 weeks, 0 days’ gestation who are younger than 12 months at the start of the RSV season. For infants born during the RSV season, fewer than 5 monthly doses will be needed.

Available data for infants born at 29 weeks, 0 days’ gestation or later do not identify a clear gestational age cutoff for which the benefits of prophylaxis are clear. For this reason, infants born at 29 weeks, 0 days’ gestation or later are not universally recommended to receive palivizumab prophylaxis. Infants 29 weeks, 0 days’ gestation or later may qualify to receive prophylaxis on the basis of congenital heart disease (CHD), chronic lung disease (CLD), or another condition.

Palivizumab prophylaxis is not recommended in the second year of life on the basis of a history of prematurity alone.

Some experts believe that on the basis of the data quantifying a small increase in risk of hospitalization, even for infants born earlier than 29 weeks, 0 days’ gestation, palivizumab prophylaxis is not justified.

PRETERM INFANTS WITH CLD

Prophylaxis may be considered during the RSV season during the first year of life for preterm infants who develop

CLD of prematurity defined as gestational age <32 weeks, 0 days and a requirement for >21% oxygen for at least the first 28 days after birth.

During the second year of life, consideration of palivizumab prophylaxis is recommended only for infants who satisfy this definition of CLD of prematurity and continue to require medical support (chronic corticosteroid therapy, diuretic therapy, or supplemental oxygen) during the 6-month period before the start of the second RSV season. For infants with CLD who do not continue to require medical support in the second year of life prophylaxis is not recommended.

INFANTS WITH HEMODYNAMICALLY SIGNIFICANT CHD

Certain children who are 12 months or younger with hemodynamically significant CHD may benefit from palivizumab prophylaxis. Children with hemodynamically significant CHD who are most likely to benefit from immunoprophylaxis include infants with acyanotic heart disease who are receiving medication to control congestive heart failure and will require cardiac surgical procedures and infants with moderate to severe pulmonary hypertension.

Decisions regarding palivizumab prophylaxis for infants with cyanotic heart defects in the first year of life may be made in consultation with a pediatric cardiologist.

These recommendations apply to qualifying infants in the first year of life who are born within 12 months of onset of the RSV season.

The following groups of infants with CHD are not at increased risk of RSV infection and generally should not receive immunoprophylaxis:

- Infants and children with hemodynamically insignificant heart disease (eg, secundum atrial septal

defect, small ventricular septal defect, pulmonic stenosis, uncomplicated aortic stenosis, mild coarctation of the aorta, and patent ductus arteriosus)

- Infants with lesions adequately corrected by surgery, unless they continue to require medication for congestive heart failure
- Infants with mild cardiomyopathy who are not receiving medical therapy for the condition
- Children in the second year of life

Because a mean decrease in palivizumab serum concentration of 58% was observed after surgical procedures that involve cardiopulmonary bypass, for children who are receiving prophylaxis and who continue to require prophylaxis after a surgical procedure, a post-operative dose of palivizumab (15 mg/kg) should be considered after cardiac bypass or at the conclusion of extracorporeal membrane oxygenation for infants and children younger than 24 months.

Children younger than 2 years who undergo cardiac transplantation during the RSV season may be considered for palivizumab prophylaxis.

CHILDREN WITH ANATOMIC PULMONARY ABNORMALITIES OR NEUROMUSCULAR DISORDER

No prospective studies or population-based data are available to define the risk of RSV hospitalization in children with pulmonary abnormalities or neuromuscular disease. Infants with neuromuscular disease or congenital anomaly that impairs the ability to clear secretions from the upper airway because of ineffective cough are known to be at risk for a prolonged hospitalization related to lower respiratory tract infection and, therefore, may be considered for prophylaxis during the first year of life.

IMMUNOCOMPROMISED CHILDREN

No population based data are available on the incidence of RSV hospitalization in children who undergo solid organ or hematopoietic stem cell transplantation. Severe and even fatal disease attributable to RSV is recognized in children receiving chemotherapy or who are immunocompromised because of other conditions, but the efficacy of prophylaxis in this cohort is not known. Prophylaxis may be considered for children younger than 24 months of age who are profoundly immunocompromised during the RSV season.

CHILDREN WITH DOWN SYNDROME

Limited data suggest a slight increase in RSV hospitalization rates among children with Down syndrome. However, data are insufficient to justify a recommendation for routine use of prophylaxis in children with Down syndrome unless qualifying heart disease, CLD, airway clearance issues, or prematurity (<29 weeks, 0 days' gestation) is present.

CHILDREN WITH CYSTIC FIBROSIS

Routine use of palivizumab prophylaxis in patients with cystic fibrosis, including neonates diagnosed with cystic fibrosis by newborn screening, is not recommended unless other indications are present. An infant with cystic fibrosis with clinical evidence of CLD and/or nutritional compromise in the first year of life may be considered for prophylaxis. Continued use of palivizumab prophylaxis in the second year may be considered for infants with manifestations of severe lung disease (previous hospitalization for pulmonary exacerbation in the first year of life or abnormalities on chest radiography or chest computed tomography that persist when stable) or weight for length less than the 10th percentile.

RECOMMENDATIONS FOR TIMING OF PROPHYLAXIS FOR ALASKA NATIVE AND AMERICAN INDIAN INFANTS

On the basis of the epidemiology of RSV in Alaska, particularly in remote regions where the burden of RSV disease is significantly greater than the general US population, the selection of Alaska Native infants eligible for prophylaxis may differ from the remainder of the United States. Clinicians may wish to use RSV surveillance data generated by the state of Alaska to assist in determining onset and end of the RSV season for qualifying infants.

Limited information is available concerning the burden of RSV disease among American Indian populations. However, special consideration may be prudent for Navajo and White Mountain Apache infants in the first year of life.

DISCONTINUATION OF PALIVIZUMAB PROPHYLAXIS AMONG CHILDREN WHO EXPERIENCE BREAKTHROUGH RSV HOSPITALIZATION

If any infant or young child receiving monthly palivizumab prophylaxis experiences a breakthrough RSV hospitalization, monthly prophylaxis should be discontinued because of the extremely low likelihood of a second RSV hospitalization in the same season (<0.5%).

USE OF PALIVIZUMAB IN THE SECOND YEAR OF LIFE

Hospitalization rates attributable to RSV decrease during the second RSV season for all children. A second season of palivizumab prophylaxis is recommended only for preterm infants born at <32 weeks, 0 days' gestation who required at least 28 days of oxygen after birth and who continue to require

supplemental oxygen, chronic systemic corticosteroid therapy, or bronchodilator therapy within 6 months of the start of the second RSV season.

LACK OF THERAPEUTIC EFFICACY OF PALIVIZUMAB

Passive antibody administration is not effective in treatment of RSV disease and is not approved or recommended for this indication.

PREVENTION OF HEALTH CARE-ASSOCIATED RSV DISEASE

No rigorous data exist to support palivizumab use in controlling outbreaks of health care-associated disease, and palivizumab use is not recommended for this purpose. Infants in a neonatal unit who qualify for prophylaxis because of CLD, prematurity, or CHD may receive the first dose 48 to 72 hours before discharge to home or promptly after discharge.

Strict adherence to infection-control practices is the basis for reducing health care-associated RSV disease.

RSV SEASONALITY

Because 5 monthly doses of palivizumab at 15 mg/kg per dose will provide more than 6 months (>24 weeks) of serum palivizumab concentrations above the desired level for most children, administration of more than 5 monthly doses is not recommended within the continental United States. For qualifying infants who require 5 doses, a dose beginning in November and continuation for a total of 5 monthly doses will provide protection for most infants through April and is recommended for most areas of the United States. If prophylaxis is initiated in October, the fifth and final dose should be administered in February, which will provide protection for most infants through March. If

prophylaxis is initiated in December, the fifth and final dose should be administered in April, which will provide protection for most infants through May.

Variation in the onset and offset of the RSV season in different regions of Florida may affect the timing of palivizumab administration. Data from the Florida Department of Health may be used to determine the appropriate timing for administration of the first dose of palivizumab for qualifying infants. Despite varying onset and offset dates of the RSV season in different regions of Florida, a maximum of 5 monthly doses of palivizumab should be adequate for qualifying infants for most RSV seasons in Florida.

Sporadic RSV infections occur throughout the year in most geographic locations. During times of low RSV prevalence (regardless of proportion of positive results), prophylaxis with palivizumab provides the least benefit because of the large number of children who must receive prophylaxis to prevent 1 RSV hospitalization.

EFFECT OF PALIVIZUMAB PROPHYLAXIS ON SUBSEQUENT WHEEZING

Prophylaxis is not recommended for primary asthma prevention or to reduce subsequent episodes of wheezing.

SUMMARY OF GUIDANCE

- In the first year of life, palivizumab prophylaxis is recommended for infants born before 29 weeks, 0 days' gestation.
- Palivizumab prophylaxis is not recommended for otherwise healthy infants born at or after 29 weeks, 0 days' gestation.
- In the first year of life, palivizumab prophylaxis is recommended for preterm infants with CLD of prematurity, defined as birth at <32 weeks, 0 days'

gestation and a requirement for >21% oxygen for at least 28 days after birth.

- Clinicians may administer palivizumab prophylaxis in the first year of life to certain infants with hemodynamically significant heart disease.
- Clinicians may administer up to a maximum of 5 monthly doses of palivizumab (15 mg/kg per dose) during the RSV season to infants who qualify for prophylaxis in the first year of life. Qualifying infants born during the RSV season may require fewer doses. For example, infants born in January would receive their last dose in March.
- Palivizumab prophylaxis is not recommended in the second year of life except for children who required at least 28 days of supplemental oxygen after birth and who continue to require medical intervention (supplemental oxygen, chronic corticosteroid, or diuretic therapy).
- Monthly prophylaxis should be discontinued in any child who experiences a breakthrough RSV hospitalization.
- Children with pulmonary abnormality or neuromuscular disease that impairs the ability to clear secretions from the upper airways may be considered for prophylaxis in the first year of life.
- Children younger than 24 months who will be profoundly immunocompromised during the RSV season may be considered for prophylaxis.
- Insufficient data are available to recommend palivizumab prophylaxis for children with cystic fibrosis or Down syndrome.
- The burden of RSV disease and costs associated with transport from remote locations may result in a broader use of palivizumab for RSV prevention in Alaska Native

populations and possibly in selected other American Indian populations.

- Palivizumab prophylaxis is not recommended for prevention of health care-associated RSV disease.

TECHNICAL REPORT

Updated Guidance for Palivizumab Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for Respiratory Syncytial Virus Infection

abstract

FREE

Guidance from the American Academy of Pediatrics (AAP) for the use of palivizumab prophylaxis against respiratory syncytial virus (RSV) was first published in a policy statement in 1998. Guidance initially was based on the result from a single randomized, placebo-controlled clinical trial conducted in 1996–1997 describing an overall reduction in RSV hospitalization rate from 10.6% among placebo recipients to 4.8% among children who received prophylaxis. The results of a second randomized, placebo-controlled trial of children with hemodynamically significant heart disease were published in 2003 and revealed a reduction in RSV hospitalization rate from 9.7% in control subjects to 5.3% among prophylaxis recipients. Because no additional controlled trials regarding efficacy were published, AAP guidance has been updated periodically to reflect the most recent literature regarding children at greatest risk of severe disease. Since the last update in 2012, new data have become available regarding the seasonality of RSV circulation, palivizumab pharmacokinetics, the changing incidence of bronchiolitis hospitalizations, the effects of gestational age and other risk factors on RSV hospitalization rates, the mortality of children hospitalized with RSV infection, and the effect of prophylaxis on wheezing and palivizumab-resistant RSV isolates. These data enable further refinement of AAP guidance to most clearly focus on those children at greatest risk. *Pediatrics* 2014;134:e620–e638

Palivizumab is a humanized mouse immunoglobulin (IgG1) monoclonal antibody produced by recombinant DNA technology. The antibody is directed against a conserved epitope of the A antigenic site of the fusion (F) protein of respiratory syncytial virus (RSV) and demonstrates both neutralizing and fusion inhibitory activity.¹ The antibody consists of 2 heavy chains and 2 light chains; 95% of the amino acid sequences (framework) are of human origin, and 5% (antigen binding sites) are of mouse origin. After intramuscular administration, palivizumab is distributed hematogenously throughout the body, including the lower respiratory tract. When RSV encounters palivizumab in the lower respiratory tract, antibody binds to F protein and prevents the structural

(Continued on last page)

conformational change that is necessary for fusion of the viral RSV envelope with the plasma membrane of the respiratory epithelial cell.² Without fusion, the virus is unable to enter the cell and unable to replicate. In addition, palivizumab prevents cell-to-cell fusion of RSV-infected cells.²

BACKGROUND

Palivizumab was licensed by the US Food and Drug Administration (FDA) in June 1998, largely on the basis of results of the IMpact-RSV trial conducted during the 1996–1997 RSV season. This randomized, placebo-controlled, double-blind trial involved 1501 infants and young children born preterm (at or before 35 weeks' gestation), some of whom had chronic lung disease (CLD) of prematurity.³ The IMpact-RSV trial demonstrated an RSV hospitalization rate of 10.6% in the placebo arm and 4.8% among high-risk infants who received prophylaxis, a reduction of 5.8% in RSV hospitalizations ($P < .001$).³ A second randomized, double-blind, placebo-controlled trial conducted from 1998 to 2002 enrolled 1287 children with hemodynamically significant congenital heart disease (CHD).⁴ This cardiac trial evaluated both the safety and efficacy of palivizumab prophylaxis and demonstrated an RSV hospitalization rate of 9.7% in the placebo arm and 5.3% among recipients of palivizumab prophylaxis, a reduction in the RSV hospitalization rate of 4.4% ($P < .003$). No additional placebo-controlled trials regarding the efficacy of palivizumab prophylaxis in any other subgroup have been published.

Palivizumab was licensed for the prevention of severe lower respiratory tract disease in pediatric patients at increased risk of severe RSV disease.¹ Recommendations from the American Academy of Pediatrics (AAP) for use of prophylaxis have evolved since licensure

of palivizumab as additional information has become available.

In addition, peer-reviewed data have been published since preparation of the most recent guidance in 2012.⁵ This technical report reviews the newer and older scientific literature to offer guidance on the most appropriate use of palivizumab prophylaxis, as published in the accompanying policy statement.⁶ Current guidance is risk stratified, targeting infants at greatest risk of severe disease and most likely to benefit from prophylaxis on the basis of evaluation of the published literature. Therefore, not all infants enrolled in the 2 randomized trials are included in the current guidance. Twenty-one AAP sections and committees plus groups outside the AAP have contributed to and concur with the updated guidance presented in the accompanying policy statement.

AAP guidance regarding the use of palivizumab was first published in a policy statement⁷ in 1998 and subsequently was revised in a 2003 policy statement,⁸ the 2006 *Red Book*,⁹ a 2009 policy statement,¹⁰ and most recently in the 2012 *Red Book*.⁵ The AAP guidance for palivizumab prophylaxis is being updated at this time to reflect the ongoing assessment by the Committee on Infectious Diseases (CID) of peer-reviewed publications, as exemplified in the following areas:

- Data regarding palivizumab pharmacokinetics¹¹;
- Data on the seasonality of RSV circulation^{12,13};
- Data on overall declining incidence of hospitalizations for bronchiolitis in the United States¹⁴;
- Data demonstrating that mortality rates in children hospitalized with laboratory-confirmed RSV are lower than previously estimated¹⁵;
- Data demonstrating a statistically significant but clinically minimal

reduction of wheezing episodes among recipients of palivizumab prophylaxis^{16,17};

- Reports indicating little benefit of palivizumab prophylaxis among patients with cystic fibrosis or Down syndrome^{18–20};
- Reports describing palivizumab resistant RSV isolates from hospitalized patients who receive prophylaxis^{21–23}; and
- Independently conducted cost analyses demonstrating a high cost versus limited benefit from palivizumab prophylaxis.^{24,25}

In addition, the complexity of the current guidance has resulted in lack of prophylaxis for some children who qualify, whereas other children who do not qualify receive prophylaxis that may not be indicated.^{26,27} The goal of this updated guidance is to present more clearly the CID recommendations for palivizumab use for infants and young children who are most likely to derive benefit from prophylaxis and, in the process, to simplify guidance for pediatricians and other clinicians. It is important to note that using the same aggregate data, prophylaxis guidelines from other countries such as the United Kingdom are more restrictive than AAP guidance for the United States, and no evidence of excess morbidity has been observed.^{28,29}

Indications contained in a package label reflect data from clinical trials conducted by the sponsor and submitted to the FDA for drug licensure. The FDA does not issue guidelines or recommendations for drug use. The palivizumab package inserts states “Synagis is indicated for the prevention of serious lower respiratory tract disease caused by RSV in children at high risk of RSV disease.”¹ In the absence of a specific definition of “high risk” by the FDA, the AAP has endeavored since palivizumab was

first licensed to provide more precise guidance for determining those at increased risk.^{5,7,8,10} The same is true with this revision.

ADMINISTRATION

Palivizumab is administered intramuscularly at a dosage of 15 mg/kg once a month. The drug is packaged in single-dose liquid solution vials at 50 mg/0.5 mL and 100 mg/1.0 mL and does not contain preservative. A vial cannot be stored once it is opened, so a vial-sharing scheme is important to minimize waste. Anaphylaxis has occurred after palivizumab administration after initial exposure or reexposure, with some cases of severe hypersensitivity reactions reported.¹

RSV IMMUNOPROPHYLAXIS AND VACCINE ADMINISTRATION

Palivizumab does not interfere with the immune response to live or inactivated vaccines. The childhood immunization schedule should be followed for all children, regardless of palivizumab use.¹

GUIDANCE FOR PALIVIZUMAB PROPHYLAXIS

Burden of RSV Disease

In the United States, RSV remains an important cause of hospitalization in the first months of life. Retrospective analyses using national databases and *International Classification of Diseases, Ninth Revision* discharge diagnoses have shown considerable variation in estimates of annual hospitalization rates attributable to RSV for infants.^{30–33} More recent prospective population-based studies of laboratory confirmed cases demonstrate that RSV hospitalization rates are approximately half the rates reported in retrospective studies, yet rates remain high.^{14,34–36}

It is estimated that approximately 2.1 million children younger than 5 years

require medical care as inpatients or as outpatients for RSV infection annually. Among outpatients, 60% (1.3 million) are 2 through 5 years of age, and the remaining 40% are between birth and 2 years of age.³⁵ Approximately 25% of RSV-infected children younger than 5 years are assessed and treated in an emergency department, and approximately 70% are assessed and treated in a pediatric office. It is estimated that each year, nearly 58 000 children in the first few years of life are hospitalized because of RSV infection.³⁵ Infants in the second month after birth have the highest RSV hospitalization rate, a rate that is almost twice that of the next highest risk group (infants in the first month after birth).³⁴

Preterm Infants Without CLD

In 2012, 3.95 million births were reported in the United States. Preterm infants (singleton and multiple births) born at less than 37 weeks' gestation represented 11.6% of all births.³⁷ Preterm births of infants at less than 28 weeks' gestation accounted for 0.7% of the annual birth cohort.³⁷ Infants born from 32 weeks to 35 weeks' gestation represented approximately 9% of the birth cohort.

Beginning with the first AAP statement in 1998,⁷ the high cost of palivizumab influenced recommendations for use by the COID, leading to attempts to identify risk factors for RSV hospitalization among the large number of moderately preterm infants. The New Vaccine Surveillance Network (NVSN), sponsored by the Centers for Disease Control and Prevention (CDC) was a prospective population-based surveillance program from 3 geographically diverse locations in the United States for young children hospitalized with laboratory-confirmed RSV respiratory illness. Several studies were published summarizing data from the NVSN. One

conducted during the RSV seasons from 2000 through 2005 using multiple logistic-regression analyses of data revealed that some of the previously reported potential risk factors, including siblings in the household and child care attendance, were not associated with a significantly increased risk of RSV hospitalization.³⁴ In this study, only young chronologic age was significantly correlated with risk of hospitalization for RSV illness. The association between preterm birth and increased risk of severe illness was not specific for RSV.³⁵

In addition, data from the NVSN study revealed that for all preterm infants (<37 weeks' gestation), the RSV hospitalization rate was 4.6/1000 children, which was not significantly different from the hospitalization rate for term infants, which was 5.3/1000 children (Table 1).³⁴ Rates were derived from 132 085 children born during the study period, among whom 2149 were hospitalized with acute respiratory illness, and 559 of the hospitalized children had laboratory-confirmed RSV (Table 1). Infants born at <30 weeks' gestation experienced a higher RSV hospitalization rate (18.7/1000 children) than early preterm infants (30–33 weeks),³⁴ although the small number of infants born before 30 weeks' gestation limits the generalizability of this data. Late preterm infants were hospitalized significantly less often than term infants for RSV infection.³⁴

An analysis of Tennessee Medicaid data for children younger than 3 years conducted from July 1989 to June 1993 (preimmunoprophylaxis era) included 248 652 child-years of follow-up. The retrospective cohort analysis was conducted to determine RSV hospitalization rates among infants with different degrees of prematurity and other comorbidities.³⁸ Within each age group, preterm infants had similar

TABLE 1 Average RSV Hospitalization Rates Among Children Younger Than 24 Months (2000–2005)³⁴

Children <24 mo	N ^a	RSV Hospitalization Rate/1000	95% CI
All infants regardless of gestational age	559 ^b	5.2	4.8–5.7
All term infants (≥37 wk gestation)	479	5.3	4.9–5.8
All preterm infants (<37 wk gestation)	56	4.6	3.4–5.8
≥35 wk gestation	494	5.1	4.7–5.5
32–34 wk gestation	23	6.9	4.3–10.1
29–31 wk gestation	6	6.3	2.0–12.4
<29 wk gestation	12	19.3	8.4–34.0
All very preterm (<30 wk gestation)	15 ^c	18.7	10.0–30.0

^a Among 2149 enrolled hospitalized children from a birth cohort of 132 085 children.

^b The total of 559 children hospitalized with RSV includes 24 whose gestational age could not be verified.

^c Personal communication, Geoffrey A. Weinberg, MD.

rates of RSV hospitalization, regardless of the degree of prematurity (Table 2). In this analysis, preterm infants with CLD were categorized separately to reduce confounding.

A historical cohort analysis from Rochester, New York, reported on RSV hospitalization rates among 1029 consecutive preterm infants born before or at 32 weeks' gestation during a 5-year period.³⁹ The RSV hospitalization rate increased with decreasing gestational age, with a breakpoint at ≤28 weeks' gestation (Table 3). Among infants born at or before 26 weeks' gestation, the risk of RSV-associated hospitalization was 13.9% vs 4.4% among children hospitalized at >30 to 32 weeks' gestation. There was not a statistically significant difference in RSV hospitalization rates between infants with gestational ages of >28 to 30 weeks and infants with gestational ages of >30 to 32 weeks.

A retrospective cohort study of infants enrolled in Medicaid in Texas and

Florida between 1999 and 2004 examined RSV hospitalization rates in moderately preterm infants 32 to 34 weeks' gestation.⁴⁰ Less than 20% of each cohort received palivizumab prophylaxis. In Florida, 71 (3.1%) of the moderately preterm infants were hospitalized compared with 1246 (1.5%) of term infants, and in Texas 164 (4.5%) of the preterm infants were hospitalized compared with 3815 (2.5%) of term infants. Palivizumab prophylaxis was associated with decreased hospitalization in moderately preterm infants in Texas but not in Florida. The risk of RSV hospitalization in moderately preterm infants was similar to 1-month-old term infants by 4.2 months in Florida (95% confidence interval [CI], 2.5–5.7) and by 4.5 months in Texas (95% CI, 2.8–6.4).⁴⁰

Choosing an appropriate cutoff for gestational age for which palivizumab prophylaxis may be considered for preterm infants without other indications is challenging. Data consistently

demonstrate the greatest increase in risk for hospitalization is in preterm infants born before 29 weeks' gestation. These infants have hospitalization rates 2 to 4 times higher than later preterm infants (Tables 1, 2, and 3). The consensus of the COLD and the Bronchiolitis Guidelines Committee is that palivizumab prophylaxis may be considered for infants, without other indications, whose gestational age is less than 29 weeks (28 weeks, 6 days or fewer). The available data do not support universal recommendations for palivizumab prophylaxis for preterm infants born at or after 29 weeks' gestation.

Data regarding the risk of RSV hospitalization for most preterm infants do not support a benefit from prophylaxis. In recent large cohort studies of moderately preterm infants, the majority of whom did not receive palivizumab, 2.5% to 4.9% required hospitalization for RSV infection during the RSV season indicating that more than 95% did not require hospitalization.⁴⁰ The rate of hospitalization among infants ≥35 weeks' gestation (5.1/1000) was no different than the rate for term infants (5.3/1000; Table 1). The hospitalization rate of infants ≥30 weeks to 35 weeks' gestation indicate only a slight increase in risk (less than twofold; Tables 1, 2, and 3). Data concerning host or environmental risk factors for hospitalization in preterm infants without CLD or CHD are inconsistent, with the exception of age

TABLE 2 RSV Hospitalizations per 1000 Children From >248 000 Child-Years of Follow-up³⁸

Age Stratum/Risk Group	0 to <6 mo	6 to <12 mo	12 to <24 mo	IRR (95% CI) for 0 to <6 mo	Adjusted IRR (95% CI) for first 12 mo
Low-risk infants	44.1	15.0	3.7	Comparator	Comparator

>30–32	453	20	4.4	Comparator
Total	1029	78	7.6	Not applicable

younger than 3 months at the start of the RSV season, which has been associated with an increased risk of hospitalization.³⁴

For all infants, particularly those who are preterm, the environment should be optimized to prevent RSV and other viral respiratory infections by offering breast milk feeds, immunizing household contacts with influenza vaccine, practicing hand and cough hygiene, and by avoiding tobacco or other smoke exposure and attendance in large group child care during the first winter season, whenever possible.

Preterm Infants With CLD

Studies have documented that infants and young children with CLD have increased rates of RSV hospitalization.^{38,39} Results from the IMpact-RSV trial evaluating all preterm infants with CLD (*n* = 762 randomized preterm infants) demonstrated that the RSV hospitalization rate among placebo recipients was 12.8% and 7.9% among palivizumab recipients (*P* = .038).³

Infants With Hemodynamically Significant CHD

The results of an industry-funded multicenter, randomized, double-blind, placebo-controlled trial of palivizumab prophylaxis among 1287 children (639 palivizumab recipients, 648 placebo recipients) younger than 24 months with hemodynamically significant CHD was published in 2003.⁴ Results from this study demonstrated a reduction in RSV hospitalization rates of 4.4% (9.7% among placebo recipients and 5.3% among palivizumab recipients;

P = .003).⁴ The reduction in the number of RSV hospitalizations between the 2 study groups was 29 fewer RSV hospitalizations among palivizumab recipients during the 4 years of the study.⁴ Prophylaxis with palivizumab appeared to have less benefit among cyanotic children than among acyanotic children. Among children in the cyanotic group, there were 23 fewer RSV hospitalizations per 1000 palivizumab recipients (7.9% vs 5.6%, *P* = .285). Among children in the acyanotic group, there were 68 fewer RSV hospitalizations per 1000 prophylaxis recipients (11.8% vs 5.0%; *P* = .003). Despite enrolling 1287 subjects, the trial did not have sufficient power to detect statistically significant differences among subgroups of children with different cardiac lesions.

A retrospective analysis of the effect of palivizumab prophylaxis on RSV hospitalizations among children with hemodynamically significant CHD was conducted in California. The authors estimated a statewide 19% reduction in RSV hospitalization between 2000 and 2002 (preprophylaxis era) and 2004 and 2006 (prophylaxis era) after the licensure of palivizumab for children with CHD. The authors concluded that in the state of California, 7 fewer RSV hospitalizations per year occurred among children younger than 2 years with hemodynamically significant CHD following recommendations for palivizumab prophylaxis in this group.⁴¹

Other investigators describe rates of RSV hospitalizations among patients with hemodynamically significant CHD (2%–3%) who do not receive pro-

phylaxis as lower than the 9.7% rate reported in the placebo arm of the cardiac study.^{42–46} As the rate of RSV hospitalization decreases among children who do not receive prophylaxis, the cost to prevent 1 hospitalization with prophylaxis increases.

A retrospective analysis of children younger than 3 years (248 652 child-years) in the Tennessee Medicaid program revealed that the RSV hospitalization rate for children with CHD in the second year of life (18.2/1000) was less than half the hospitalization rate for low-risk infants in the first 5 months after birth (44.1/1000), a group for whom palivizumab prophylaxis is not recommended³⁸ (Table 2). Thus, prophylaxis is not recommended during the second year of life.

Children With Anatomic Pulmonary Abnormalities or Neuromuscular Disorder

The risk of RSV hospitalization is not well defined in children with neuromuscular disorders that impair the ability to clear secretions from the upper airway because of ineffective cough, recurrent gastroesophageal tract reflux, pulmonary malformations, tracheoesophageal fistula, upper airway conditions, or conditions requiring tracheostomy.

Studies suggest children and infants with neuromuscular disease who are hospitalized with RSV infection tend to be older compared with other groups of patients hospitalized with RSV infection and are more likely to have preexisting immunity to RSV.^{47,48} This may reflect the progressive nature of neuromuscular disease, with susceptibility to respiratory disease tract increasing with age.

Immunocompromised Children

Population-based data are not available on the incidence or severity of RSV disease among children who receive

solid organ transplants (SOTs) or hematopoietic stem cell transplants (HSCTs), children who receive chemotherapy, or children who are immunocompromised because of other conditions. Progression of RSV infection from upper to lower respiratory tract disease depends on the virulence of the RSV strain, as well as specific abnormalities in the immunocompromised host's immune response attributable to the underlying disease or to chemotherapy.

RSV infection in immunocompromised children and adults can progress to respiratory failure and death.^{49,50} Lymphopenia has been recognized as a risk factor for disease progression in several studies of immunocompromised patients. One study in adults noted that progression of RSV to lower respiratory tract disease did not occur in patients with a lymphocyte count greater than 1000 cells/mm³ at time of onset of upper respiratory tract infection.⁵¹ An absolute lymphocyte count of 100 cells/mm³ or less at the time of RSV upper tract infection was associated with progression to lower respiratory tract disease. In contrast to lymphopenia, analysis of antibody concentration in these adult HSCT recipients indicated no correlation between preexisting anti-RSV antibody concentration and progression from upper to lower respiratory tract disease.⁵¹

A retrospective report from 1 institution described 58 immunocompromised children with RSV infection between 1997 and 2005.⁵² Sixty-five percent of the RSV-infected children were managed as outpatients. No deaths occurred among 28 children infected with RSV who were receiving chemotherapy for acute lymphoblastic leukemia or among 11 immunosuppressed SOT recipients. Five of 58 patients with lower respiratory tract infection died (8.6%), including 4 children who were allogeneic HSCT recipients and

1 child with severe combined immune deficiency. One of the deaths occurred in a 10-year-old child, and a second death occurred in a child with *Aspergillus* species coinfection. Profound lymphopenia (<100 cells/mm³) was associated with progression to lower respiratory tract disease.⁵²

Another retrospective report from 1 institution noted 5 deaths among 117 RSV-infected, immunocompromised patients between 2006 and 2011 (2 with severe combined immunodeficiency, 1 with uncharacterized immunodeficiency, 1 with chronic granulomatous disease, and 1 SOT recipient).⁵³ The deaths occurred in children who presented with community-acquired RSV lower respiratory tract infection. No deaths occurred among children who were HSCT recipients or those with leukemia or lymphoma.

A third retrospective review of RSV infections in children with cancer was conducted from 1998 to 2009.⁵⁴ Among 57 patients, 37% experienced progression to lower respiratory tract disease. Three patients died of respiratory failure within 60 days of RSV diagnosis (1 had concomitant bacteremia and fungemia and 1 had concomitant herpes simplex pneumonia).

In a review of 208 viral respiratory infections among 166 patients over a 13-year period who received HSCTs, SOTs, or chemotherapy for malignancy, RSV infection accounted for 43% of the infections.⁵⁵ The mean and median ages of patients at the time of infection were 6.1 years and 4.3 years, with a range of 2 months to 21 years of age. Death occurred in 17 (8%) of patients with viral respiratory infection, including 6 of 88 (7%) RSV-infected children who received allogeneic HSCTs or SOTs. No infection resulted in death among patients who received chemotherapy, despite being severely immunosuppressed. Mortality and morbidity

did not have a statistically significant correlation with the degree of immune suppression.

Risk factors for a poor outcome after RSV infection in an immunosuppressed host include age younger than 2 years, presence of lower respiratory tract symptoms at presentation (particularly in the absence of symptoms of upper respiratory infection), corticosteroid therapy, and varying degrees of lymphopenia. Underlying diagnosis, degree of immune suppression, RSV load in bronchoalveolar lavage, or specific humoral immunity to RSV have not been found to correlate with outcome.⁵⁶ This inability to correlate degree of immunosuppression with disease severity indicates an incomplete understanding of the immune response to viral respiratory infections in an immunocompromised host.

Antibody-based treatments, including immune globulin and palivizumab, have not been associated with improved outcome in HSCT recipients.⁵⁷ No data are available to suggest benefit from immunoprophylaxis among immunocompromised patients, and practices vary nationwide.^{58,59} Further research is required before definitive recommendations can be made for the use of palivizumab in this heterogeneous group of children.

Children With Down Syndrome

Several factors appear to place children with Down syndrome at increased risk of RSV lower respiratory tract disease than children without Down syndrome.^{18,19,60,61} CHD, with or without pulmonary hypertension, occurs in approximately 45% of children with Down syndrome, and lesions include atrioventricular canal, ventricular septal defect, patent ductus arteriosus, and tetralogy of Fallot. Anatomic abnormalities of the upper or lower respiratory tract, muscle dystonia, and intrinsic immune dysfunction may

contribute to viral respiratory disease in this population.

One population-based cohort study over an 11-year period in Colorado revealed a statewide total of 85 RSV hospitalizations among 680 children with Down syndrome during their first 2 years of life. Concurrent risk factors were present in 35 of the 85 (41%) hospitalized children, indicating they would have qualified for prophylaxis for other reasons. RSV hospitalization rates were 67/1000 child-years for children with Down syndrome and other risk factors, 42/1000 child-years for children with Down syndrome without cardiopulmonary disease, and 12/1000 child-years for children in a control group.⁶¹ These data suggest an estimated overall 7.7 RSV admissions per year (85 admissions per 11 years) in the state of Colorado for children with Down syndrome. Using these figures, 4.6 RSV hospitalizations per year occur among children with Down syndrome without concurrent factors (50 admissions per 11 years) in Colorado. Assuming a 55% reduction in hospitalization, approximately 2 to 3 hospitalizations per year might have been avoided from prophylaxis administered to 680 children. Although children with Down syndrome were more likely to experience a temperature >38°C, the median duration of stay for children younger than 1 year of age with Down syndrome was 4 days, and for children without Down syndrome the median was 3 days. No deaths were reported in this study.⁶¹ These data suggest children with Down syndrome have a slightly higher hospitalization rate, but the absolute number of RSV hospitalizations is small, and a number of children with Down syndrome are at increased risk because of qualifying heart disease or other factors.

Another report described 39 of 395 (9.9%) children with Down syndrome hospitalized because of RSV infection

in the first 2 years of life.⁶⁰ Among hospitalized children, 38% had hemodynamically significant heart disease. This study had insufficient power to differentiate among subgroups, meaning the increased RSV hospitalization rate may have been explained by concurrent risk factors and not Down syndrome.⁶⁰ Another study of 41 children with Down syndrome hospitalized with RSV infection noted that 51% had underlying CHD.¹⁸ An additional report of 222 children with Down syndrome hospitalized with RSV infection noted the mean age of hospitalized children (1.3 years; range, 0–6.1 years) was significantly older than the age of children hospitalized with RSV who did not have Down syndrome. A similar finding was noted in the Colorado report, with a mean age of 9.6 months at admission for RSV infected patients with Down syndrome and no other risk factors. In this study, the age range for hospitalization extended through 17 years.⁶¹ RSV prophylaxis for the first year of life would have limited effect on RSV hospitalization for children with Down syndrome without other risk factors for RSV.^{19,61}

Children With Cystic Fibrosis

Available studies indicate the incidence of RSV hospitalization in children with cystic fibrosis is uncommon and unlikely to be different from children without cystic fibrosis. Evidence to support a benefit from palivizumab prophylaxis in patients with cystic fibrosis is not available.^{20,62,63}

A randomized clinical trial with palivizumab prophylaxis included 186 children with cystic fibrosis from 40 centers. One subject in the untreated group and 1 subject in the palivizumab group were hospitalized for RSV infection.⁶⁴ Although this study was not powered for efficacy, no clinically meaningful differences in outcome between the 2 groups were reported.

At the 12-month follow-up, there was no significant difference between the treated and untreated groups in number of *Pseudomonas* colonizations or change in weight-to height ratio. A case-control study of palivizumab in 75 children with cystic fibrosis noted a possible trend toward a potential clinical benefit of palivizumab prophylaxis, but the difference was not statistically significant.⁶²

A large study of RSV hospitalizations occurring between 1997 and 2003 in Danish children with chronic medical conditions identified 72 children with cystic fibrosis.⁶⁵ There were 13 RSV-related hospitalizations, which resulted in an adjusted incidence rate ratio for risk of RSV hospitalization of 4.32 (95% CI, 2.42–7.71). The geometric mean ratio for duration of RSV hospitalization in these children with cystic fibrosis was 1.3 days (95% CI, 0.81–2.11 days).

Two recent reviews^{20,66} of RSV infection in infants with cystic fibrosis acknowledged that infants with cystic fibrosis may have a slightly increased risk for hospitalization with RSV. However, they both stated that there is insufficient evidence related to safety and efficacy in infants with cystic fibrosis to support a recommendation of palivizumab prophylaxis.^{20,66} A survey of cystic fibrosis center directors published in 2008 noted that palivizumab prophylaxis is not the standard of care for patients with cystic fibrosis.⁶⁷

Discontinuation of Palivizumab Prophylaxis Among Children Who Experience Breakthrough RSV Hospitalization

RSV is classified into subgroups A and B, based on antigenic differences in the surface G glycoprotein. Subgroups are classified further into genotypes based on genetic analysis. The ability of RSV to cause reinfections throughout life likely

is attributable both to strain variability and to an immune response that does not fully protect against subsequent infection. Reinfections with both heterologous and homologous strains occur. More than 1 RSV strain may circulate concurrently in a community. However, repeat RSV hospitalizations during 1 season are rare.

One study identified 726 RSV lower respiratory tract infections among 1560 children younger than 5 years over 8 successive RSV seasons in an outpatient setting.⁶⁸ Only 1 instance of repeat RSV infection occurred during the same season. Furthermore, it is well established that repeat RSV infections are associated with less severe clinical illness than the initial RSV infection.^{69,70}

In the blinded and randomized cardiac trial that involved 1287 children younger than 24 months with hemodynamically significant CHD, a total of 5 readmissions for a second RSV hospitalization occurred (a rate of less than 0.5%). Three of 648 children in the placebo group and 2 of 639 children who received palivizumab had more than 1 RSV hospitalization over 4 years.⁴

In the Dutch trial of 429 preterm infants randomly assigned to receive either palivizumab prophylaxis or placebo between April 2008 and December 2010, infants were followed for recurrent wheezing. No RSV reinfections were detected in either group, again indicating that repeat RSV infections in the same year seldom occur.¹⁶

Use of Palivizumab in the Second Year of Life

A prospective population-based surveillance study of 5067 children younger than 5 years evaluated 564 children hospitalized with laboratory-confirmed RSV infection. Among the children hospitalized with RSV infection, 75% were younger than 12 months. Less than 20% of all pediatric RSV hospitalizations

occurred during the second year of life.³⁵

Limited safety data and no efficacy data are available regarding palivizumab prophylaxis in the second year of life.^{71,72} Regardless of the presence or absence of comorbidities, RSV hospitalization rates decline during the second RSV season for all children.^{34,38} In a retrospective cohort study conducted over 4 years and involving 248 652 child-years, RSV hospitalization rates in the second year of life for children with comorbidities were lower than the rate for healthy term infants in the first 12 months of life, a group for whom prophylaxis is not recommended³⁸ (Table 2).

Lack of Therapeutic Efficacy of Palivizumab

Controlled studies have demonstrated that monoclonal antibodies have no therapeutic benefit in the treatment of RSV infected children. One randomized study determined that intravenous palivizumab administered to RSV-infected, intubated infants reduced the RSV viral load in the lower respiratory tract but had no effect on RSV concentration in the upper respiratory tract.⁷³ Despite a reduction in viral load in the lower respiratory tract, no difference in disease severity was found between palivizumab recipients and placebo recipients. A phase 2 therapeutic trial involving 118 hospitalized, RSV infected infants evaluated the outcome among recipients of intravenous motavizumab at 30 mg/kg or at 100 mg/kg compared with placebo.⁷⁴ Motavizumab is an investigational monoclonal antibody with enhanced potency relative to palivizumab. No significant effect on RSV viral load in the upper respiratory tract was detected among motavizumab recipients. No difference in duration of hospitalization, requirement for supplemental oxygen, ICU admission, or need for mechanical ventilation between groups was detected.

Prevention of Health Care-Associated RSV Disease

Strict infection-control practices, including restriction of visitors to the neonatal ICU during respiratory virus season, will decrease health care-associated RSV disease. Evidence does not support the use of palivizumab among hospitalized preterm infants to prevent health care-associated spread of RSV.^{75,76} If an RSV outbreak occurs in a high-risk unit (eg, pediatric or neonatal ICU or HSCT unit), primary emphasis should be placed on proper infection-control practices, especially hand hygiene. No rigorous data exist to support palivizumab use in controlling outbreaks of health care-associated disease. Further, hospitalization rates for RSV infection do not differ among infants who receive inpatient palivizumab prophylaxis while in the neonatal ICU compared with those who initiate prophylaxis at hospital discharge.⁷⁷

CONSIDERATIONS AFFECTING REVISION OF GUIDANCE

Risk Factors for RSV Hospitalization

Overall, approximately 2% to 3% of infants in the first 12 months of life are hospitalized with RSV infection each year in the United States. Children with certain comorbidities are at increased risk of severe RSV disease relative to children without these comorbidities.^{35,38} Chronologic age is the single most important risk factor for RSV hospitalization on the basis of the observation that more than 58% to 64% of pediatric RSV hospitalizations occur in the first 5 months after birth.^{34,35,38} Most of these hospitalizations occur in the first 90 days after birth.^{22,34,40} Certain subgroups of infants with comorbidities such as prematurity, CLD, or hemodynamically significant CHD have increased risks for RSV hospitalization, although the

degree of risk varies among studies.^{30,78} The risk of RSV hospitalization associated with most other risk factors has been difficult to determine because of low rates of occurrence. Most host and environmental factors increase the risk for RSV hospitalization by only a small magnitude, so their contribution to overall disease burden is limited.⁷⁹ In addition, these factors are not identified consistently from study to study. These inconsistencies likely reflect variation in practice patterns in different countries, variation in living conditions and climate, variation in health care coverage, yearly variation in disease severity, and incompletely understood genetic factors. Differences in study design may contribute to these differences.

Reported host risk factors of limited (inconsistent) impact include the following: congenital malformations, congenital airway anomaly, neuromuscular impairment, birth weight, gender, lack of breastfeeding, duration of breastfeeding, cord serum anti-RSV antibody concentration, small for gestational age, Down syndrome, epilepsy, cord blood vitamin D concentration, family history of atopy, viral load, malnutrition, multiple births, and singletons versus multiple birth subjects. Environmental risk factors of limited (variable) impact include the following: environmental pollution, crowded living conditions, living at increased altitude, meteorological conditions, low parental education, low socioeconomic status, child care attendance, size of child care facility, month of birth, smoke exposure, maternal smoking during pregnancy, and proximity to hospital care.^{30,35,38,47,48,60,65,78,80–94} One publication suggested that malformations of the urinary tract increase the risk of RSV hospitalization.⁶⁵

Multiple logistic-regression analyses of data from the 4-year population-based prospective study revealed that

of the evaluated risk factors (male gender, child care attendance, smoke exposure, lack of breastfeeding, and other children in the house), only preterm birth and young chronologic age independently correlated with more severe RSV disease after adjusting for other covariates.³⁵

RSV Seasonality

During the 6 RSV seasons from July 2007 to January 2013, the median duration of the RSV season ranged from 13 to 23 weeks, with median peak activity from mid-December to early February, with the exception of Florida and Alaska (see later discussions for each).^{12,13} Within the 10 Health and Human Services Regions, in the few regions when the RSV season began in October, the season ended in March or early April. In regions where the RSV season began in November or December, the season ended by April or early May. Because 5 monthly doses of palivizumab at 15 mg/kg per dose will provide more than 6 months of serum palivizumab concentrations above the desired serum concentration for most infants, administration of more than 5 monthly doses is not recommended within the continental United States.¹¹ Children who qualify for 5 monthly doses of palivizumab prophylaxis should receive the first dose at the time of onset of the RSV season. For qualifying infants born during the RSV season, fewer than 5 doses will be needed to provide protection until the RSV season ends in their region (maximum of 5 doses).

A small number of sporadic RSV hospitalizations occur before or after the main season in many areas of the United States,^{79,95} but maximum benefit from prophylaxis is derived during the peak of the season and not when the incidence of RSV hospitalization is low.

Prophylaxis for Alaska Native/American Indian Children and Timing of Palivizumab Initiation

Hospitalization rates for all causes of bronchiolitis as high as 484 to 590/1000 infants have been described in isolated Inuit populations.^{96–99} Alaska Native infants in southwestern Alaska experience higher RSV hospitalization rates and a longer RSV season. On the basis of the epidemiology of RSV in Alaska, particularly in remote regions, the selection of infants eligible for prophylaxis may differ from the remainder of the United States. Clinicians may wish to use RSV surveillance data generated by the state of Alaska to assist in determining onset and end of the RSV season for appropriate timing of palivizumab administration.¹⁰⁰

Two published studies have documented a bronchiolitis hospitalization rate in Navajo populations that was 91.3 to 96.3/1000 infants younger than 1 year.^{101,102} This rate was similar to those seen with high-risk groups, such as infants born preterm and those with CLD. There are no data on efficacy of palivizumab in this population. However, if local data support a high burden of RSV disease in select American Indian populations, selection of infants eligible for prophylaxis may differ from the remainder of the United States for infants in the first year of life.

Timing of Prophylaxis for the State of Florida

Variation in the onset and offset of the RSV season in different regions of Florida may affect the timing of palivizumab administration. Florida Department of Health data may be used to determine the appropriate timing for administration of the first dose of palivizumab for qualifying infants. Despite varying onset and offset dates of the RSV season in different regions of Florida, a maximum of 5 monthly

doses of palivizumab will be adequate for qualifying infants for most RSV seasons in Florida. Even if the first of 5 monthly doses is administered in July, protective serum concentrations of palivizumab will be present for most infants and young children for at least 6 months and likely into February. More than 5 monthly doses are not recommended, despite the detection of a small number of cases of RSV infection outside this time window. A small number of sporadic RSV hospitalizations occur before or after the main season in many areas of the United States, but maximum benefit from prophylaxis is derived during the peak of the season and not when the incidence of RSV hospitalization is low.

Pharmacokinetics of Palivizumab

A threshold protective serum palivizumab concentration in humans has not been established. On the basis of studies of palivizumab prophylaxis with the cotton rat, serum concentrations of 25 to 30 mcg/mL produced a mean reduction in pulmonary RSV concentrations of 99% ($2 \log_{10}$).^{103,104} Because of the reliability of the cotton rat model to predict results in humans, this serum concentration became the target trough concentration in the randomized clinical trials.^{3,4} The package label states “palivizumab serum concentrations of greater than or equal to 40 mcg/mL have been shown to reduce pulmonary RSV replication in the cotton rat model of RSV infection by 100 fold.”¹

Palivizumab pharmacokinetic data published by the manufacturer in 2012 demonstrate that after 5 monthly doses, serum concentrations of palivizumab remain at or above protective levels for most children for at least 6 months (>24 weeks).¹¹ There is seldom justification to administer more than 5 doses within the continental United States. These data were derived from

a computer model based on 22 clinical trials.

Weight dosing at 15 mg/kg resulted in similar palivizumab concentrations in healthy term infants as well as pre-term infants.¹¹

Race and Sex

Data from the NVSN demonstrate that the overall rate of RSV hospitalization does not differ between African American and white children younger than 24 months of age (5.4/1000 for African American children and 4.7/1000 for white children).³⁴ Among infants younger than 6 months, RSV hospitalization rates for African American and white children were not significantly different.³⁴ Another report from NVSN evaluated 564 children hospitalized with RSV infection. Neither race nor ethnic group was found to be an independent risk factor for hospitalization.³⁵ A third CDC report revealed rates of RSV coded illness in African American and white children to be similar at 5.3/1000 (95% CI, 3.7–6.9/1000) and 5.3/1000 (95% CI, 4.3–6.3/1000), respectively.³³ Hospitalization rates did not differ during the years of this study (1997–1999 and 2004–2006) by African American or white race. In this study, hospitalization rates for RSV-coded illness were 7.5/1000 boys (95% CI, 5.9–9.1) and 5.9/1000 girls (95% CI, 4.5–7.3).

Another population-based study evaluated racial disparities between African American and white children who were hospitalized because of RSV infection in 3 large United States counties.¹⁰⁵ No disparity was found in any county for any of the 7 years studied among children in the first 12 months of life or between infants 0 to 2 months or infants 3 to 5 months of age. Because of small numbers, reliable estimates for other race groups are not available.³³ RSV hospitalization

rates among boys exceed that of girls in some, but not all studies.^{34,35}

Mortality Rates Among Hospitalized Children With RSV Infection

Using 2 national databases (the Pediatric Health Information System [PHIS] data for 2004–2011 and the Health Cost and Utilization Project Kids' Inpatient Database [KID] for 2009), mortality rates associated with hospitalized infants with RSV infection were lower than previously estimated. The PHIS data set from 44 children's hospitals identified 33 deaths per year (13.7 deaths/10 000 RSV admissions during the RSV season), but only 8.5 deaths/10 000 admissions were coded with RSV as the primary diagnosis, suggesting that other comorbidities were involved. In the KID data set from more than 4000 hospitals in 44 states, RSV was estimated to account for 121 deaths annually in the United States (9/10 000 RSV admissions) with 84 deaths per year occurring during the typical RSV season. In addition, as suggested by the PHIS database, nearly 80% of deaths occurred in children with complex chronic medical conditions. The mean age at time of death was 7.5 months for infants in the PHIS data set and 6.2 months in the KID data set.¹⁵

An industry-sponsored meta-analysis of published reports of fatality rates attributable to RSV infection in children suggested higher rates of death based on estimates from earlier years, likely because supportive care received in intensive care units was less effective in earlier years.¹⁰⁶

A statistically significant reduction in RSV mortality has not been demonstrated in any randomized clinical trial with palivizumab or motavizumab. Thus, inclusion of mortality reduction or life years saved is difficult to justify in a cost analysis of palivizumab prophylaxis.

Motavizumab

Motavizumab is a second-generation monoclonal antibody that differs from palivizumab by 13 amino acids. Motavizumab was developed by affinity maturation of the complementarity determining regions of palivizumab to improve binding affinity to F protein. In cell culture, motavizumab has approximately 10-fold greater neutralizing activity than palivizumab against RSV clinical isolates of both A and B subtypes.¹⁰⁷ Unlike palivizumab, motavizumab may reduce RSV viral load in the upper respiratory tract, as well as the lower respiratory tract.¹⁰⁸

Data from several clinical trials, including a noninferiority trial between palivizumab and motavizumab, were submitted to the FDA as part of the licensing application for motavizumab.^{109–111} In August 2010, the FDA rejected the license application for motavizumab. Among a number of concerns noted by the FDA was lack of greater clinical efficacy from motavizumab and a threefold increase in hypersensitivity reactions among motavizumab recipients relative to palivizumab recipients.^{107,109,112} Methodologic concerns were raised by the FDA in regard to laboratory testing procedures and geographic variation in results from the noninferiority trial. Specifically, the generalizability of the main study finding was uncertain, because the results of the primary end point differed when stratified by geographic location. The results did not reach the noninferiority threshold for the northern hemisphere, where approximately 90% of subjects were enrolled.¹⁰⁷

The overall RSV hospitalization rate was 4.8% among palivizumab recipients in the IMPact-RSV trial compared with a 1.9% RSV hospitalization rate among palivizumab recipients in the palivizumab-motavizumab noninferiority trial. It was concluded that the non-

inferiority trial may have been conducted in a population with less comorbidity than the IMPact-RSV study. The FDA requested an additional clinical trial to support a satisfactory risk–benefit profile in populations for which prophylaxis is being considered.¹⁰⁷

RSV-specific outpatient medically attended lower respiratory tract infections were reported to be significantly lower among motavizumab recipients relative to palivizumab recipients in the noninferiority trial. However, this outcome was determined in a subset of patients from selected study sites, making the risk of bias high, as noted in the FDA report.¹⁰⁷

Outpatient visits among RSV-infected children exceed the number of outpatient visits attributable to influenza infection by more than twofold.¹¹³ One study of acute respiratory infection in children younger than 8 years estimated children from birth through 23 months of age experienced overall emergency department visits attributable to RSV infection at a rate of 64.4/1000 (95% CI, 45.4–91.3) compared with a rate of 15.0/1000 (95% CI, 4.4–50.6) among influenza-infected children (27% had received influenza vaccine) during 2 respiratory virus seasons between 2003 and 2005.¹¹³ The impact of immunoprophylaxis on outpatient medically attended events attributable to RSV infection is an important consideration but remains unknown because of lack of evaluation in a rigorous, controlled fashion.

Palivizumab-Resistant Isolates

Palivizumab and motavizumab bind to a highly conserved epitope (antigenic site A) on the extracellular domain of the mature F protein that encompasses amino acids 262 to 275. After antibody binding, viral entry into the respiratory epithelial cell is blocked, as is cell-to-cell fusion of infected cells.² RSV escape mutants resistant

to palivizumab have been isolated from approximately 5% of children hospitalized with breakthrough RSV infection while receiving monthly palivizumab prophylaxis.^{1* 21,22,23,114} RSV isolates resistant to palivizumab contain mutations in codons encoding the amino acids between 262 and 275 of the F protein. Amino acid sequence variations outside antigenic site A do not appear to confer palivizumab resistance.

Effect of Palivizumab Prophylaxis on Subsequent Wheezing

Numerous studies have documented that infants hospitalized with viral lower airway disease are more likely to experience recurrent wheezing compared with infants who do not experience severe bronchiolitis.^{68,115–119} The possible effect of avoidance of RSV lower respiratory tract infection early in life with palivizumab prophylaxis on recurrent wheezing was addressed in 3 industry-sponsored studies.^{16,17,120}

One trial among preterm infants without CLD describes physician-diagnosed recurrent wheezing in 8% of prophylaxis recipients and in 16% of the control group. This trial was conducted at 27 sites, and the patients were followed for up to 24 months. Participants were not prospectively randomized, the groups were not balanced for birth weight, degree of prematurity or known RSV risk factors, and families were not blinded to study medication, making the results of uncertain significance.¹²⁰

A nonrandomized observational report from Japan compared the incidence of wheezing between 349 preterm infants (33–35 weeks' gestation) who received palivizumab prophylaxis in the first 6 months of life with 95 infants who did not receive prophylaxis. The primary end point of the study was physician-diagnosed wheezing during

a 3-year follow-up. Twenty-two of 345 infants (6.4%) who received immunoprophylaxis experienced wheezing, whereas 18 of 95 infants (18.9%) who did not receive prophylaxis developed recurrent wheezing ($P < .001$) during the 3-year follow-up period.¹⁷ No difference in hospitalization rates attributable to respiratory disease between the 2 groups was found. Concerns with this study design include the lack of randomization and blinding and the absence of standardized enrollment criteria at the 52 participating sites, each of which may have led to enrollment bias, and no information was provided on the severity of the wheezing episodes. In addition, a history of smokers in the household and family history of allergy was significantly more common in the untreated group.

A double-blind placebo-controlled trial conducted in the Netherlands addressed palivizumab prophylaxis and recurrent wheezing using a different study design.¹⁶ Parent-reported wheezing in 429 otherwise healthy late preterm infants during the first year of life was evaluated in 214 infants who received monthly prophylaxis with palivizumab compared with 215 infants who received placebo. During the first year of life, infants and young children in the placebo group experienced 2309 days with wheezing from a total 51 726 patient days (4.5%), whereas those in the palivizumab group had 930 days of wheezing of 53 075 patient days (1.8%; $P = .01$). This represents an absolute 2.7 fewer days of wheezing per 100 patient days (17.5 wheezing days/1000 days vs 44.6 wheezing days/1000 days or 27.1 fewer wheezing days/1000 days) among infants who received monthly palivizumab in contrast to those who did not receive prophylaxis.¹⁶ Reliance on parent reporting of wheezing was identified as a potential limitation. The wheezing episodes were not

medically attended events but parent-reported wheezing of unknown severity.¹⁶ The proportion of infants using bronchodilators in the placebo group was 23% and 13% among palivizumab recipients.

Cost Analyses

Financial stewardship is a concept that acknowledges a physician's responsibility to advocate "for a just and cost-effective distribution of finite resources."^{121,122} Use of noncost-effective interventions contribute to maladies within the health care system, including huge deficits, lower quality of care, and inequitable access to health care.¹²³ Financial stewardship has become an essential component of successful reform of the existing health care system.

A number of economic analyses from different countries have evaluated immunoprophylaxis use in different age groups, among children with varying comorbidities and from both the payer and the societal perspective.²⁴ Economic evaluations sponsored by the manufacturer of palivizumab suggest cost neutrality or even cost savings.^{124–134} In contrast, analyses conducted by independent investigators consistently demonstrate the cost of palivizumab prophylaxis far exceeds the economic benefit of hospital avoidance, even among infants at highest risk.^{24,25,39–42,46,90,135–143} Variation in results are explained by differences in study methodology and different base case assumptions used in the model, such as incidence of RSV hospitalization for different risk groups, effectiveness of prophylaxis in reducing hospitalization rate by risk group, estimates of cost of prophylaxis and RSV hospitalizations avoided, number of doses administered, estimated age and weight of infants, and inclusion of a theoretical benefit on mortality reduction.

The CDC has recommended quality-adjusted life years (QALYs) saved as an optimal approach to evaluate the benefit of an intervention. One analysis using this methodology for hypothetical cohorts of infants without CLD born at 26 to 32 weeks' gestation revealed the incremental cost-effectiveness ratio to be greater than \$200 000 per QALY saved for all gestational ages, a figure not considered to be cost-effective.¹³⁵

An economic analysis funded by the manufacturer of palivizumab and published in the *Journal of Medical Economics* also examined incremental cost-effectiveness ratios per QALY gained in 4 groups of preterm infants without CLD and revealed the cost of treatment with palivizumab for infants 32 to 35 weeks' gestation with ≤ 1 risk factor was \$464 476, using an average cost for palivizumab for private and public payers. Medicaid discounts were reported to have resulted in an "approximate 40% reduction in palivizumab cost for approximately 60% of palivizumab recipients."¹²⁹ Nonetheless, in most state Medicaid programs, palivizumab is one of the most costly medication expenditures.

Cost was considered during deliberations by the COLD and the Bronchiolitis Guidelines Committee, but the final guidance as presented in the accompanying Policy Statement is driven by the limited clinical benefit derived from palivizumab prophylaxis.

The American College of Physicians Clinical Guidelines Committee outlines principles to help clinicians define high-value health care by considering key concepts: benefits, harms and cost of the intervention, downstream costs that occur as a result of the intervention, and finally, the incremental cost-effectiveness ratio.¹⁴⁴ On the basis of these principles, the minimal clinical reduction in RSV hospitalizations and reduction in wheezing

episodes associated with palivizumab prophylaxis are not of sufficient clinical and societal importance to justify the cost. Although some RSV hospitalizations may be severe and prolonged, the majority of hospitalizations generally last 2 to 3 days. The high cost of palivizumab prophylaxis becomes a cost-inefficient way to prevent a few short hospitalization stays and a small number of longer hospital stays, especially in the absence of evidence of significant long-term benefit and no measurable effect on mortality.¹⁴⁴

Health expenditures should not be based only on cost and benefit but rather on the assessment of the benefit of the intervention relative to the expenditure. High-cost interventions may be appropriate if highly beneficial.¹⁴⁴ Because the high cost of palivizumab prophylaxis is associated with minimal health benefit, this intervention cannot be considered as high-value health care for any group of infants.

Control Measures

A critical aspect of RSV prevention among all infants is education of parents and other caregivers about the importance of decreasing exposure to and transmission of RSV. Preventive measures include limiting, where feasible, exposure to contagious settings (eg, child care centers) and emphasis on hand hygiene in all settings, including the home and the neonatal ICU, especially during periods when contacts of children at high risk have respiratory tract infections. For all children, the importance of breastfeeding, avoidance of crowds, and absence of exposure to tobacco smoke, including second-hand and third-hand exposure, should be emphasized.

Future Possibilities

Continued evaluation of the impact of palivizumab prophylaxis should include other groups considered to be

at increased risk of disease to evaluate reductions in RSV hospitalizations, as well as the effect of prophylaxis on medically attended outpatient visits.

Investigation of other types of passive immunoprophylaxis including anti-G monoclonal antibodies, should continue not only in prophylaxis but in treatment studies to modulate RSV disease severity.¹⁴⁵ Modification of the Fc fragment of the motavizumab molecule appears to prolong the half-life and theoretically may enable administration of fewer doses of motavizumab per season, although an increased risk of adverse effects remains a concern.^{107,146} Nanobodies are antibody-derived proteins consisting of functional heavy-chain antibodies that lack light chains and were initially found in camels and llamas. Nanobodies directed against the RSV fusion protein have demonstrated RSV-neutralizing activity in experimental models.¹⁴⁷

Ribavirin was licensed in 1986 and remains the only FDA-licensed antiviral agent for therapy but seldom is used because of limited efficacy, cumbersome delivery (aerosol), and high cost.⁵ Interest continues in developing more broadly effective antiviral agents including fusion inhibitors and small interfering RNA.^{148,149}

Development of a safe and effective RSV vaccine remains a high priority.^{150–153} Progress has been achieved with live-attenuated intranasal vaccines,¹⁵⁴ but ensuring adequate attenuation while maintaining immunogenicity remains a challenge. Early experience with a formalin-inactivated whole virus vaccine resulted in enhanced RSV disease in young children in the 1960s, which has complicated development of inactivated RSV vaccines.^{150,155} The demonstration of the effectiveness of passive prophylaxis with an anti-F monoclonal provides reassurance that antibody to the F protein is protective. New

subunit vaccines and particularly vaccines directed against the F protein administered intramuscularly or intranasally continue to be explored.^{150,155} A vaccine against a “prefusion” configuration of the F protein may offer increased efficacy with less risk of disease enhancement.¹⁵⁶ F protein viral-like particle vaccines administered during the latter half of pregnancy might offer passive protection for young children through the first months of life.^{157,158}

SUMMARY

The vast majority of RSV hospitalizations occur among healthy term infants. Immunoprophylaxis remains an option for a very small number of children, but palivizumab immunoprophylaxis will continue to have only a minimal effect on the burden of RSV disease. Effort should be made to avoid prophylaxis among infants and young children who do not qualify for prophylaxis, as outlined in the accompanying AAP policy statement.⁶

Updated Recommendations on the Use of Meningococcal Vaccines

.....

- *Policy Statement*

POLICY STATEMENT

Updated Recommendations on the Use of Meningococcal Vaccines

abstract

FREE

Since the last policy statement from the American Academy of Pediatrics (AAP) concerning meningococcal vaccine was published in 2011, 2 meningococcal conjugate vaccines have been licensed for use in infants (Hib-MenCY-TT and MenACWY-CRM). The Centers for Disease Control and Prevention (CDC) has published new recommendations, "Prevention and Control of Meningococcal Disease: Recommendations of the Advisory Committee on Immunization Practices," which have been endorsed by the AAP. However, the CDC recommendations were published before licensure of MenACWY-CRM for infant use. This policy statement updates the AAP recommendations for use of meningococcal vaccines in children and adolescents. A more comprehensive review of background and technical information can be found in the CDC publication. *Pediatrics* 2014;134:400–403

Neisseria meningitidis is responsible for a spectrum of infections, such as meningitis, bacteremia, and pneumonia, and may be associated with long-term sequelae and death. Five serogroups of *N. meningitidis* (A, B, C, W, and Y) are responsible for the vast majority of disease in children and adults. Specific meningococcal serogroups appear to cause a preponderance of disease in certain age groups and geographic areas. For example, in the United States, *N. meningitidis* serogroup B is predominant in children younger than age 5 years, whereas serogroups C and Y are responsible for the majority of cases in adolescents. *N. meningitidis* serogroup A is hyperendemic in sub-Saharan Africa (the so-called "meningitis" belt) but it is rarely diagnosed in the United States.

For unknown reasons, the incidence of meningococcal disease has decreased in the United States since the late 1990s. The decrease started before the availability of the meningococcal conjugate vaccine and recommendations for routine meningococcal vaccine use in adolescents. Declines in incidence have occurred in all serogroups, including serogroup B, which is currently not included in any meningococcal vaccine licensed in the United States.

In the United States, 4 licensed meningococcal vaccines are available. One is a quadrivalent (A, C, W-135, Y) polysaccharide vaccine (MPSV4 [Menomune, Sanofi Pasteur, Inc, Swiftwater, PA]). There are 2 quadrivalent conjugate vaccines (A, C, W, Y) (MenACWY-D [Menactra, Sanofi Pasteur, Inc] and MenACWY-CRM [Menveo, Novartis Vaccines and Diagnostics, Inc, Cambridge, MA]), and 1 bivalent (C; Y) conjugate vaccine (HibMenCY-TT [MenHibrix, GlaxoSmithKline Biologicals, Research Triangle Park, NC]), which is also approved as a vaccine for *Haemophilus influenzae* type b (Table 1).

BACKGROUND AND RATIONALE

Meningococcal vaccines are recommended routinely for adolescents and for selected groups of children at increased or persistent risk for invasive meningococcal disease (Table 2). There are 2 types of meningococcal vaccines: (1) polysaccharide and (2) conjugated polysaccharide vaccines. Conjugated polysaccharide vaccines use a T-cell–dependent mechanism that results in a more robust primary immune response and immunologic memory and boosting potential, as compared with polysaccharide-only vaccines that use a T-cell independent mechanism. The new indications and newly licensed vaccines address immunization of younger children at increased risk for meningococcal disease.

This document provides a complete update of policy recommendations of the American Academy of Pediatrics for children and adolescents.

RECOMMENDATIONS

The following are meningococcal vaccination recommendations (Table 3):

- For the pediatric population, an age-appropriate meningococcal conjugate vaccine is preferred to the meningococcal polysaccharide vaccine, unless there is a contraindication for the meningococcal conjugate vaccine.
- Adolescents should be routinely immunized at 11 to 12 years of age and given a booster dose at 16 years of age with a quadrivalent conjugated meningococcal vaccine.
- Adolescents who received their first dose at age 13 to 15 years should receive a booster at age 16 to 18 years at least 8 weeks or up to 5 years after their first dose.
- Adolescents who receive their first dose of meningococcal conjugate vaccine at or after 16 years of age do not need a booster dose.
- Unvaccinated or previously vaccinated first-year college students through age 21 years living in residence halls who received their last dose before their 16th birthday (ie, incompletely vaccinated) should receive a single dose of quadrivalent meningococcal conjugate vaccine.
- For individuals who are at increased risk for invasive meningococcal disease because of persistent complement (eg, C3, C5–C9, properdin, factor H, or factor D) deficiency or functional or anatomic asplenia, a 2-dose primary series (MenACWY-D or MenACWY-CRM) is administered to individuals 2 to 55 years of age, and a 4-dose primary series (MenACWY-CRM or Hib-MenCY-TT) is administered to children 2 to 18 months of age. MenACWY-D can be administered as a 2-dose series to infants 9 to 23 months of age with persistent complement component deficiency, and in infants up to 23 months of age after the fourth dose of the primary pneumococcal conjugate vaccine has been given in children who have functional or anatomic asplenia.
- HIV infection is not an indication for routine MenACWY immunization before 11 years of age. However, HIV-infected children 11 years of age or older should be given a 2-dose primary series 8 to 12 weeks apart (MenACWY-D or MenACWY-CRM) with a single booster dose, consistent with recommendations for healthy adolescents.
- For children older than age 2 years who have persistent risk for meningococcal disease because of complement component deficiency or asplenia, their primary series should include 2 doses of quadrivalent meningococcal conjugate vaccine 8 to 12 weeks apart (MenACWY-D or MenACWY-CRM).
- For children 2 months to 6 years of age at persistent risk for meningococcal disease (Table 2), a booster dose should be given 3 years after the primary series and every 5 years thereafter. For children and adolescents 7 years or older at persistent risk for meningococcal disease (Table 2)

TABLE 2 Children at Increased Risk for Meningococcal Disease

Persistent complement component deficiencies (C3, C5–C9, properdin, factor D, and factor H)
Functional or anatomic asplenia
Travel to or reside in an area with hyperendemic or epidemic meningococcal disease
Residence in a community with a meningococcal outbreak

TABLE 3 Recommended Meningococcal Vaccines by Age Group

Age Group	Vaccine	Routine Recommendation	Dosing Schedule
2 mo to 10 y	MCV4-D (Menactra, Sanofi) ^a	High-risk only ^a High-risk only ^b High-risk only ^c	Primary • Age 9 to 23 mo: 2-dose series with 12 weeks between doses • Age 2 to 10 y: 1 dose Booster (for persons who remain at risk) • First booster 3 y after primary series for children who received primary series before age <7 y, then every 5 y • Every 5 y for children who received primary series after 7th birthday
	MCV4-CRM (Menveo, Novartis)		Primary • Age 2 to 6 mo: 4 doses at 2, 4, 6, and 12 mo • Age 7 to 23 mo: 2 doses should be given, with the 2nd dose given in the 2nd year of life • Age 2 to 10 y: 1 dose Booster (for persons who remain at risk) • First booster 3 y after primary series for children who received primary series before age <7 y, then every 5 y • Every 5 y for children who received primary series after 7th birthday
	HibMenCY-TT (MenHibrix, GSK)		Primary • Age 2 to 18 mo: 4-dose series with doses at 2, 4, 6, and 12 to 15 mo Booster (for persons who remain at risk) • Use MCV4-D or MCV4-CRM (see above)
11 to 21 y	MCV4-ACWY-D (Menactra, Sanofi)	Healthy and high-risk	Primary: healthy • Age 11 to 15 y: 1-dose primary series with booster at 16 to 21 y • Age 16 to 21 y: 1 dose, no booster necessary Booster: healthy • Age 16 to 21 y: 1 dose Primary: high risk • 2-dose primary series for those who have asplenia, HIV infection, or persistent complement component deficiency Booster (for persons who remain at risk) • First booster 3 y after primary series for children who received primary series before age <7 y, then every 5 y • Every 5 y for children who received primary series after 7th birthday
	MCV4-ACWY-CRM (Menveo, Novartis)	Healthy and high risk	Primary: healthy • Age 11 to 15 y: 1-dose primary series with booster at 16 to 21 y • Age 16 to 21 y: 1 dose, no booster necessary Booster: healthy • Age 16 to 21 y: 1 dose Primary: high risk • 2-dose primary series for those who have asplenia, HIV infection, or persistent complement component deficiency Booster (for persons who remain at risk) • First booster 3 y after primary series for children who received primary series before age <7 y, then every 5 y • Every 5 y for children who received primary series after 7th birthday
	HibMenCY-TT (MenHibrix, GlaxoSmithKline)	Not approved for this age group	

^a For children who have complement component deficiency or functional or anatomic asplenia or who are part of a community or organizational outbreak or who are traveling internationally to a region with hyperendemic or endemic meningococcal disease. For infants receiving the vaccine before travel, the 2 doses may be administered as early as 8 weeks apart. Infants who have functional or anatomic asplenia should wait until 2 years of age to prevent immune interference with PCV13.

^b For children who have complement component deficiency or functional or anatomic asplenia, or who are part of a community or organizational outbreak or who are traveling internationally to a region with hyperendemic or endemic meningococcal disease.

^c For children who have complement component deficiency or functional or anatomic asplenia, or who are part of a community or organizational outbreak. Hib-MenCY-TT is not recommended for use in children who are traveling internationally to a region with hyperendemic or endemic meningococcal disease. MCV4 should be used as booster doses for children who are given a primary series with Hib-MenCY-TT.

whose initial meningococcal vaccination was administered at 7 years or older, boosters of quadrivalent meningococcal conjugate should be repeated every 5 years (Table 4).

SPECIAL CIRCUMSTANCES

Routine vaccination against meningococcal disease is not recommended for healthy children 2 months to 10 years of age unless they are at increased or persistent

risk for meningococcal disease (Table 2). Hib-MenCY-TT (MenHibrix) may be administered to any infant for routine vaccination against *Haemophilus influenzae* type b (Hib). If Hib-MenCY-TT is used for

TABLE 4 Schedule for Booster Doses in Individuals Who Have Persistent Increased Risk for Invasive Meningococcal Disease

Age at Last MCV4 Dose	Duration Until Next Booster Dose
2 mo to 6 y	3 y ^a
>6 y	5 y

^a If last dose was HibMenCY-TT, the booster dose should be MenACWY-D or MenACWY-CRM.

protection against meningococcal disease, it should be used for all 4 doses of Hib vaccine, and other Hib-containing vaccines should not be used.

Limited data suggest that different conjugate vaccine products can be used interchangeably. If the same vaccine product used for the first dose is not available or if it is not known which vaccine product was used previously, administration of the vaccine should not be deferred if indicated, and any licensed age-appropriate conjugate vaccine can be administered.

The meningococcal vaccine is not routinely recommended for HIV-infected children until they reach 11 years of age, similar to other non-HIV-infected adolescents. HIV-infected children should receive 2 doses as their primary series.

A primary series consisting of 2 or more doses (depending on the age of the child) is indicated for children who have asplenia (reduced antibody response after a single primary dose) and complement component deficiency (higher antibody levels are needed for bacterial clearance mechanisms, such as opsonization, and more rapid antibody waning).¹

For travelers to areas with high meningococcal endemicity (parts of sub-Saharan Africa [the so-called “meningitis belt”] or the Hajj in Saudi Arabia), an age-appropriate meningococcal

vaccine that includes serogroups A and W is indicated. Periodically, there may be other areas in the world with meningococcal outbreaks (eg, serogroup W in Chile). Travelers need to monitor this possibility. Completion of the entire series is preferred before travel as follows: (1) for children <9 months of age: 2, 4, and 6 months of age (with booster at 12 to 18 months of age) with MenACWY-CRM; (2) for children ≥9 months to 23 months of age: 2 doses separated by at least 8 weeks (MenACWY-D) or 2 doses separated by at least 3 months (Menveo); and (3) for people >24 months of age: a single dose (MenACWY-D or MenACWY-CRM).

Pregnancy and breastfeeding do not preclude vaccination with MenACWY (Menactra or Menveo) or MPSV4 (Menomune) if indicated.

PRECAUTIONS AND CONTRAINDICATIONS

Vaccination with any meningococcal vaccine is contraindicated in people known to have a severe allergic reaction to any component of the vaccine. Conjugate vaccines that contain diphtheria or tetanus toxoid are contraindicated in people who have severe allergic reactions to these toxoids. A history of Guillain-Barré syndrome is not a contraindication or precaution for meningococcal vaccination. A previous temporal relationship between MenACWY-D and Guillain-Barré syndrome was not determined to be causally related. All currently licensed meningococcal vaccines are inactivated. They can be administered to people who are immunosuppressed as a result of disease or medication. However, the response to meningococcal vaccine in immunosuppressed children may be less than optimal.

POLICY STATEMENT

Withholding or Termination of Resuscitation in Pediatric Out-of-Hospital Traumatic Cardiopulmonary Arrest

abstract

FREE

This multiorganizational literature review was undertaken to provide an evidence base for determining whether recommendations for out-of-hospital termination of resuscitation could be made for children who are victims of traumatic cardiopulmonary arrest. Although there is increasing acceptance of out-of-hospital termination of resuscitation for adult traumatic cardiopulmonary arrest when there is no expectation of a good outcome, children are routinely excluded from state termination-of-resuscitation protocols. The decision to withhold resuscitative efforts in a child under specific circumstances (decapitation or dependent lividity, rigor mortis, etc) is reasonable. If there is any doubt as to the circumstances or timing of the traumatic cardiopulmonary arrest, under the current status of limiting termination of resuscitation in the field to persons older than 18 years in most states, resuscitation should be initiated and continued until arrival to the appropriate facility. If the patient has arrested, resuscitation has already exceeded 30 minutes, and the nearest facility is more than 30 minutes away, involvement of parents and family of these children in the decision-making process with assistance and guidance from medical professionals should be considered as part of an emphasis on family-centered care because the evidence suggests that either death or a poor outcome is inevitable. *Pediatrics* 2014;133:e1104–e1116

INTRODUCTION

In 2003, the National Association of EMS Physicians and the Committee on Trauma of the American College of Surgeons published guidelines for out-of-hospital withholding or termination of resuscitation for adult victims of traumatic cardiopulmonary arrest who met specific criteria.¹ Clinical criteria included absent pulse, unorganized electrocardiogram rhythm, fixed pupils (all at the scene), and cardiopulmonary resuscitation (CPR) greater than 15 minutes. The recommendations did not extend to the pediatric population. Although many of the studies on which the recommendations were based included children, the vast majority of the involved subjects were adults. Studies published to that time that addressed the pediatric population in particular^{2,3} and evaluated survival and functional outcome of pediatric blunt trauma victims with either full traumatic cardiopulmonary

(Continued on last page)

arrest or severe hypotension suggested that the prognosis for pediatric traumatic cardiopulmonary arrest victims is similar to that for adults. Given the emotional demands of withholding resuscitation from a child in the field, it was believed by both the leadership in pediatric trauma care and emergency medical services (EMS) that additional studies were warranted before including children in any termination-of-resuscitation protocol. This literature review in pediatrics was undertaken to provide an evidence base for determining whether recommendations for out-of-hospital termination of resuscitation could be made. The project aims were to (1) identify whether specific criteria exist that would support out-of-hospital withholding or termination of resuscitation for traumatic cardiopulmonary arrest victims and (2) identify a specific time frame for any subset of pediatric trauma patients beyond which further resuscitative efforts are futile.

METHODS

Organizational participants included the Committee on Trauma, Subcommittee on Emergency Services—Prehospital, and Pediatric Surgical Specialty Group of the American College of Surgeons; Committee on Pediatric Emergency Medicine of the American Academy of Pediatrics; National Association of EMS Physicians; and Pediatric Committee of the American College of Emergency Physicians. The initial review was completed in September 2008, and additional literature through 2011 was added to provide currency to the review. General guidelines for evaluation included the following:

1. Distinguish between blunt and penetrating trauma victims.
2. Define “pediatric patient” as 18 years of age or younger.
3. Determine location of arrest (out-of-hospital or emergency department [ED]).

Specific characteristics of the arrest were determined, if possible, as follows:

1. Distinguish between respiratory and cardiopulmonary arrest (from any cause).
2. Determine duration of witnessed arrest.
3. Determine duration of resuscitation to successful return of spontaneous circulation (ROSC).
4. Determine outcome of children who had successful ROSC: did they survive to reach the hospital, survive to hospital discharge, and have long-term neurologic function?
5. Determine duration of resuscitation efforts in nonsurvivors.
6. Determine effects of epinephrine administration.
7. Determine outcome of thoracotomy when used.
8. Exclude special circumstances: drowning (warm or cold water), hypothermia, burns, electrocution (lightning, electric fence).
9. Determine any caveats with regard to survival to be an organ donor.

Methodology for the evidence evaluation was based on the 2000 Eastern Association for the Surgery of Trauma guideline “Utilizing Evidence-Based Outcome Measures to Develop Practice Management Guidelines: A Primer.”⁴ Class I evidence is derived from prospective, randomized, controlled trials; class II evidence represents clinical studies in which data were collected prospectively or retrospective analyses that were based on clearly reliable data; and class III evidence is based on retrospectively collected data. A validity scale for class I was detailed by Jadad et al in 1996.⁵ Recommendations were classified as level 1, 2, or 3 according to the following definitions:

1. Level 1: The recommendation is convincingly justifiable based on the available scientific information alone. This recommendation is usually based on class I data; however, strong class II evidence may form the basis for a level 1 recommendation, especially if the issue does not lend itself to testing in a randomized format. Conversely, low-quality or contradictory class I data may not be able to support a level 1 recommendation.
2. Level 2: The recommendation is reasonably justifiable by available scientific evidence and strongly supported by expert opinion. This recommendation is usually supported by class II data or a preponderance of class III evidence.
3. Level 3: The recommendation is supported by available data, but adequate scientific evidence is lacking. This recommendation is generally supported by class III data. This type of recommendation is useful for educational purposes and in guiding future clinical research.

Each article was assigned at least 2 reviewers. The assignments were known only to the project director. All articles were also reviewed by the project director, and evidence class was reconciled as needed.

LITERATURE REVIEW

MedLine and PubMed were searched for the initial review through Ovid from 1980 to 2006. Subsequently, the review was updated with literature as recent as 2011. Search terms included traumatic cardiopulmonary arrest, blunt trauma, cardiorespiratory arrest, resuscitative thoracotomy, out-of-hospital cardiac arrest, out-of-hospital termination of resuscitation, cardiopulmonary resuscitation, EMS, advanced life support, basic life support, outcome, survival, children, and adolescent. Article

bibliographies were hand-searched for additional references. New citations were added and assigned as appropriate. Abstracts were included only if a companion manuscript was identified. Editorials, letters to the editor, and studies that included only adults were eliminated. Published articles that included only victims of drowning were ultimately eliminated after review because the special circumstance of hypothermia and/or cold water drowning may alter resuscitation. Studies that included both adults and children were used if the children were evaluated separately or if data relevant only to children could be abstracted from the text. Studies that mixed traumatic arrests and arrests from other causes were used only if the trauma cohort was described independently. Only trauma patients who suffered a cardiopulmonary arrest rather than isolated respiratory arrest were included. Individual patients were included for review only if they could be tracked through the published article such that some outcome (ie, at least survival to hospital discharge) could be determined. The arrest interval or time to resuscitation was defined, in a witnessed arrest, as the time between the occurrence of arrest and the time that CPR was instituted, whether by a bystander or professional. Resuscitation time was defined as the duration of CPR until either ROSC or death was declared.

RESULTS

Fifty-four articles were retrieved for the initial review.^{2,3,6-57} Of these, 35 were eliminated for the reasons described previously,⁶⁻⁴⁰ leaving 19 articles with potentially useful information.^{2,3,41-57} An additional 23 articles were screened for the secondary review,⁵⁸⁻⁸¹ with 9 articles appropriate for inclusion.^{58,64-69,72,81} There were 2 sets of patients included in 2 articles each, and data were used only once.^{53,72,74,80} There were 5 class II studies and 22 class III studies.

From the 27 articles, there were 1114 patients who suffered an out-of-hospital traumatic cardiopulmonary arrest, with 60 surviving to hospital discharge (5.4%). Outcome data were available in 23 articles for 51 of these patients (Table 1): 29 suffered neurologic devastation and were either severely disabled or in a vegetative state,^{2,6,41,44,53,64,66,68} 3 patients had moderate disability,^{3,42,66} and 19 survived with a "good" or full neurologic recovery.^{3,42,66,68,69} A separate evidentiary table provides data for cases of out-of-hospital traumatic cardiopulmonary arrest in children for which outcome was not reported (Table 2).^{56,59,72,81}

A uniform system of describing disability was not used by all authors, although the most popular system was the pediatric cerebral performance category (PCPC; Table 3).⁸² Thirty-six patients suffered an out-of-hospital traumatic cardiopulmonary arrest from penetrating injuries, and at least 9 of them had a resuscitative thoracotomy in an ED; all of these patients died regardless of whether thoracotomy was performed.^{3,50-52,68} Resuscitative thoracotomy was performed at the scene, in the ED, or in the operating room, for 30 patients (combined blunt and penetrating trauma victims) who suffered an out-of-hospital traumatic cardiopulmonary arrest, and there were no survivors.^{3,50-52} A few published articles mentioned children who were declared dead in the field, implying that the state or country has a do-not-resuscitate protocol for a subset of arrest victims.^{3,47,48,78,79}

Cause of death, interval of arrest to CPR, and total resuscitation time for survivors were reported in a few articles. Specific anatomic causes of death were only rarely mentioned in published articles and included blunt trauma to the brain and spinal cord⁴³ and penetrating injuries to the head/brain, liver,

spleen, heart, and aorta.⁵⁰ In a recent report, 78% of nonsurvivors had a traumatic brain injury.⁶⁶ It was difficult to abstract time to initiation of resuscitation and total resuscitation times for trauma patients from most articles. Information for arrests of all causes was available in a few. For example, interval to CPR was 2.3 minutes for survivors and 6.5 minutes for nonsurvivors in a Canadian study of 41 patients who had an unexpected cardiac arrest,⁴⁸ and median interval to initiation of CPR in a prospective study from California that included arrests from all causes was 3 minutes (range, 0-5 minutes) among survivors and 13 minutes (range, 4-64 minutes) among nonsurvivors.⁵³ Reported survivor mean ED resuscitation time in 1 article, exclusive of field resuscitation, was 11.4 minutes,⁴² and survivor median resuscitation time in another report was 14 ± 2.5 minutes (in the ED).⁴⁵ One article further described 5 survivors with a mean resuscitation time in the ED of 57.8 (SD, 25.5 minutes), and all had either severe disability or a vegetative state at discharge.⁴¹ An outlier survivor in terms of resuscitation time had a good outcome with a combined 42 minutes of out-of-hospital and ED resuscitation.⁴⁵ In a study describing 56 pediatric patients with out-of-hospital traumatic cardiopulmonary arrest, 20 of the 56 trauma patients were revived by initial in-hospital CPR (ROSC, ≥ 20 minutes), but only 1 patient whose outcome was not disclosed was eventually discharged from the hospital alive.⁵⁸ In 2010, a retrospective review of pediatric out-of-hospital traumatic cardiopulmonary arrest documented 6 survivors of a patient cohort of 30 patients.⁶⁶ CPR greater than 15 minutes and fixed pupils distinguished nonsurvivors from survivors, and adult criteria based on those of Hopson et al¹ correctly predicted 100% of those who died when all of the criteria were met. The mean duration of CPR was 42

TABLE 1 Evidentiary Table for Out-of-Hospital Traumatic Cardiopulmonary Arrest in Children Where Outcome Was Reported

Authors	No. of Trauma Victims	Survivors	Outcome	Special Circumstances	Class
Hazinski et al 1994 ²	38	1	Severe disability (9.5-y-old functioning as nonambulatory 1-y-old)	Out-of-hospital intubation did not influence likelihood of reanimation	II
Suominen et al 1998 ³	28	1	Moderate disability	Run over by train, airway obstructed, spontaneous circulation within 17 min of the accident and after 5 min of resuscitation	III
Pitetti et al 2002 ⁴¹	53	1	Severely disabled (PCPC 4; see Table 3)	Survivors likely to be in sinus rhythm on arrival in ED, to have received fewer doses of epinephrine in ED	III
Kuisma et al 1995 ⁴²	10	1	Partial disability, capable of self-care (Bloom III; see Table 2)	Mean resuscitation times for survivors and nonsurvivors was 11.4 and 30.6 min; bystander initiated related to favorable outcome, survivor had ROSC in 17 min	III
Calkins et al 2002 ⁴³	16	0			III
Ronco et al 1995 ⁴⁴	26	1	Severely disabled (examined by a neurologist, no scoring system)	Median ED resuscitation time for both survivors and nonsurvivors was 30 min; only intact survivor was resuscitated before ED arrival	III
O'Rourke, 1986 ⁴⁵	10	2	Vegetative state		III
Thompson et al 1990 ⁴⁶	28	2	Severely disabled		III
Tsai and Kalisen, 1987 ⁴⁷	6	0			III
Friesen et al 1982 ⁴⁸	13	0		Interval between arrest and institution of active CPR was 2.3 min in survivors and 6.5 min in nonsurvivors	II
Sirbaugh et al 1999 ⁴⁹	44	0			II
Sheikh and Culbertson 1993 ⁵⁰	13	0		All had ED thoracotomy within 5 min of ED arrival	III
Beaver et al 1987 ⁵¹	17	0		All had ED thoracotomy after a mean of 22 min of conventional resuscitation	III
Powell et al 1988 ⁵²	9	0		All had ED thoracotomy; all scene arrest patients died	III
Young et al 2004 ⁵³ (same as Brindis et al 2011 ⁸⁰)	118	6	All severe disability or vegetative state (PCPC 4 or 5)	No survivor who had ED CPR >31 min had a good neurologic outcome	II
Patterson et al 2005 ⁵⁴	59	0		No long-term trauma survivors with use of either standard or high-dose epinephrine	II
Martin et al 2002 ⁵⁵	7	0		All patients in study had pulseless electrical activity at scene	III
Broides et al 2000 ⁵⁷	7	0			III
Widdel et al 2010 ⁶⁹	30	1	Good neurologic outcome	Survivor had 2 min of out-of-hospital CPR; aggressive resuscitation is rarely successful	III
Horisberger et al 2002 ⁶⁵	16	0			III
Capizzani et al 2010 ⁶⁶	30	6	2 with good neurologic outcome, 1 fair, 3 poor	CPR >15 min and fixed pupils were predictive of death or poor outcome	III
Fisher and Worthen 1999 ⁶⁴	65	1	1 survivor in persistent vegetative state		III
Murphy et al 2010 ⁶⁸	169	28	55% survived intact but one-third of these required no airway support	66 patients transferred from another hospital; no children survived if CPR was ongoing at ED arrival	III
Total	812	51 (6.3%)		29 (57%) severe disability; 3 (6%) moderate disability; 19 (37%) normal	

minutes (SD, 28 minutes) for nonsurvivors and 7 minutes (SD, 3 minutes) for survivors. Three patients were discharged from the hospital with orders for outpatient rehabilitation services, and 3 patients required extensive rehabilitation and require 24-hour assistance

with activities of daily living. A recently published multicenter cohort study of out-of-hospital pediatric cardiac arrest included 15 children with traumatic cardiopulmonary arrest (total, 138 patients), and 3 survived.⁶⁷ Although PCPC scores were used for

survivors, it was not possible to determine outcomes for these 3 children. However, survivors from all causes had a median duration and interquartile range of CPR of 18.5 minutes (3.5–28.5 minutes) versus 41 minutes (24–54 minutes) for nonsurvivors.

TABLE 2 Evidentiary Table for Out-of-Hospital Traumatic Cardiopulmonary Arrest in Children for Whom Outcome Was Not Reported

Authors	No. of Trauma Victims	Survivors	Outcome	Special Circumstances	Class
Lin et al 2007 ⁵⁸	56	1	Outcome not reported	20/56 patients revived in ED with ROSC all ≥ 20 min	III
Li et al 1999 ⁵⁶	182	2	Unable to determine	National Pediatric Trauma Registry data, <2% of patients who were asystolic on admission were discharged alive	III
Moler et al 2011 ⁷² (same as Moler et al 2009 ⁷⁴)	15	3	Unable to determine	Median duration and interquartile range of CPR of 18.5 (3.5–28.5) min	III
Stockinger et al 2004 ⁸¹	49	3	Unable to determine		III
Total	302	9 (3%)			

TABLE 3 Disability Scoring Systems

PCPC ⁵⁷	
1	Normal
2	Mild disability
3	Moderate disability
4	Severe disability
5	Coma or vegetative state
6	Brain dead
Bloom Classification ⁹²	
I	No disability, active life
II	Mild disability, active life
III	Partial disability, but capable of self-care
IV	Total disability, incapable of self-care

A few articles addressed the use of epinephrine in out-of-hospital cardiopulmonary arrest in terms of survival, with some noting that survivors often needed no epinephrine. At least 3 authors associated more than 2 or 3 doses of standard dose epinephrine with death, although not necessarily among trauma victims, and 1 had survivors who had received up to 4 doses.^{35,41,53,67}

The mean attempted resuscitation time in many studies averaged 30 minutes. Most child survivors of out-of-hospital traumatic cardiopulmonary arrest undergoing resuscitative efforts of this duration were neurologically devastated. The 3 patients who had moderate disability had ROSC after approximately 17 minutes of CPR.^{3,42,66} Normal outcome was seen more often in trauma victims who had a perceived rapid ROSC, although an exact time in minutes was difficult to extract from the article with the majority of survivors who had a normal neurologic status.⁶⁸

A few articles made specific reference to organ donation, mentioning that sustained ROSC may serve as a bridge to possible organ donation and is necessary to prevent organ failure before harvesting.⁵⁸ However, it was noted by another group that it is ethically inappropriate to proceed with resuscitation solely to preserve organs because the physician may be more committed to the potential well-being of an unknown recipient rather than the patient at hand or his or her family members. Traditionally, cadaveric organ transplantation operates under the “dead donor rule,” and organ recovery must not be the direct cause of the donor’s death, a concept that is justified by the prohibition against the direct killing of innocent persons. Furthermore, the added expense associated with organ preservation, until such time as decoupling has occurred and the family can be approached about donation, is generally the responsibility of the donor family. If the family decides to donate, future expenses will be born by the organ procurement organization on behalf of the recipient.⁸³ If the family declines the opportunity to donate, this added expense and burden is not offset by a perceived benefit to the family.⁴⁴

DISCUSSION

Each year in the United States, 16 000 children suffer cardiopulmonary arrest.⁵⁹ Inpatient results are improving,

but the outcome for pediatric traumatic out-of-hospital arrests remains poor, although newer evidence suggests that children and adolescents with out-of-hospital arrest from other causes are more likely to survive than adults.^{41,53,59–62,78,84} Pediatric out-of-hospital deaths represent nearly one-third of pediatric deaths in the United States,⁸⁵ and in 1 urban study, 2% of pediatric EMS calls were attributed to pediatric out-of-hospital arrests.⁶³ Some of the more current studies of out-of-hospital arrest exclude trauma. Trauma is the leading cause of death from 1 through 21 years of age, and homicide or child abuse is the leading cause of trauma in children younger than 1 year⁸⁶; therefore, the optimal management of pediatric out-of-hospital traumatic cardiopulmonary arrest deserves special attention and will be the primary focus of the recommendations based on this review. Because many of the articles used for this review include pediatric arrests with multiple etiologies, making a few general observations about pediatric cardiopulmonary arrest is pertinent.

In a large 3-year prospective study of out-of-hospital arrests attributable to all causes in children younger than 12 years,⁵³ 8.6% of the children survived, one-third of whom had a good neurologic outcome. No patient who received more than 3 doses of epinephrine or more than 31 minutes of resuscitation in the ED survived. In

a more recent review of the literature and science of pediatric resuscitation, Topjian et al reported that 5% to 10% of pediatric out-of-hospital arrest victims survive to hospital discharge, with 0% to 12% having good neurologic outcomes.⁵⁹ Indicators of potential for successful outcomes in pediatric out-of-hospital arrest include a witnessed arrest, the occurrence of early bystander CPR, an initial shockable rhythm, and ROSC within 20 minutes.⁸⁴ In the absence of these characteristics, a good outcome is extraordinarily unlikely. However, anecdotal reports of children who survive after a prolonged resuscitation exist and lend unease to including them in generalized protocols. Although the outcome of pediatric inpatient cardiac arrests, generally associated with primary cardiac disease, is better than for adults, the outcome for pediatric out-of-hospital resuscitation is substantially worse because out-of-hospital arrests in children are more commonly caused by severe trauma, prolonged respiratory arrest, or septic shock rather than a primary cardiac etiology.⁵⁹ These etiologies imply a longer period of hypoxia before the actual arrest, with resulting brain and other organ damage. As noted previously, the mean resuscitation time in most pediatric studies was an average of 30 minutes. Most children with out-of-hospital traumatic cardiopulmonary arrest who received this duration of resuscitation and survived were irreversibly neurologically devastated.^{2,6,41,44,53,64,66,68} Two of the 3 patients who suffered only moderate disability had ROSC after approximately 17 minutes of CPR.^{3,42} Documentation of ROSC for the 19 children who had return to baseline or near-baseline status was reported for only 3 of the children as 2 minutes and less than 15 minutes.^{66,69} In the series that quoted the largest number of intact survivors ($n = 16$),

the authors acknowledged that one-third of survivors presented with a stable airway and did not require intubation for respiratory support. There was also a uniform distribution across all injury severity score groups for survivors, with more than half of those survivors having an injury severity score greater than 16. These findings caused the authors to reflect that almost half of the survivors had either an exceedingly rapid response to out-of-hospital CPR or out-of-hospital findings that may not have warranted CPR intervention at all.⁶⁸ In fact, it has been recognized that some children who undergo CPR in the out-of-hospital setting are unlikely to have been pulseless because of the difficulty of recognizing pulselessness in children.^{60,86}

ED crowding in the United States is an emerging threat to patient safety and public health, particularly in safety-net hospitals.^{88–90} Although the effects of ED crowding on patient care and outcome are complex, transport of a nonviable patient from the field to the ED has the secondary effect of making the resources of the EMS personnel unavailable for those who might benefit from crucial immediate attention. A series of articles by Morrison et al validating the termination of resuscitation rule estimated that the frequency of out-of-hospital adult cardiac arrest transports to the ED could be reduced from 100% to 37.4% of calls, with no loss of viable patients, thus resulting in valuable resource and cost savings.^{91–93} In addition to the cost concerns, the “lights and siren” run is associated with significant potential for injury to EMS personnel and the public.^{94–97} Finally, the costs of supplies (often including precious blood products) and the emotional toll on ED providers who would not

otherwise be exposed to the death, including the risk of posttraumatic stress disorder, are all important considerations that should not be ignored when choosing whether to transport a patient who is already dead or who will inevitably die (unpublished survey data; in process to submit for publication).

It is for these reasons that there is increasing acceptance of termination of resuscitation for adults when there is no hope for a good outcome.^{1,76,91,92,98–101} Although the same justifications apply to children, especially in light of worse out-of-hospital resuscitation outcomes, children are routinely excluded from termination-of-resuscitation protocols, at least in the United States.¹ Approximately half of states have formalized termination of resuscitation in statute or protocol, but only a few apply them to children. In a recent Melbourne, Australian, study of out-of-hospital arrest, 29 patients had attempts at resuscitation discontinued in the field. Including the 7% of patients who had no attempts at resuscitation, this represented 20.6% who were declared dead at the scene by paramedics.⁷⁹

Beyond the resource-saving benefits associated with termination of resuscitation, 2 small studies indicate that families of adult patients who die in the out-of-hospital setting may actually adapt better to their losses when there is cessation of futile resuscitative efforts in the field.^{102,103} Many states have EMS protocols or statutes that allow do-not-resuscitate orders or a declaration of death in the field for adult victims with obvious signs of death, including decapitation, hemicorporectomy, lividity, rigor mortis, and decomposition, although even these states may exclude children from such protocols and procedures. The Resuscitation Outcomes Consortium reported that no EMS resuscitation was performed in 19% of children, and the

Australian reported that no EMS resuscitation was performed in 7%.

There remains a profound reluctance to stop futile resuscitative efforts when the patient is a child.⁹⁸ On the basis of the literature to date, the reluctance stems from provider and public ignorance of out-of-hospital arrest outcomes,^{26–27,29,103–105} fear related to inadequate preparation for communication with acutely grieving family members,^{26,106} perceived determinants of family adaptation to loss, and concerns regarding legal liability for providers. The issue of whether families benefit from futile resuscitative measures in the field and ED has not been studied. The Institute of Medicine study “Emergency Care for Children: Growing Pains”⁹⁰ corroborates that the provision of even routine emergency care for children provokes stress and anxiety for EMS providers because of lack of knowledge, training, and pediatric-specific experience.^{107,108} Increased training and information is desired by EMS providers¹⁰⁹ and seems to mitigate the discomfort in some settings.^{26,29,109,110}

There are no US studies of the needs of families of children at the scene of the death, although it is the time of the most tremendous shock and the time when EMS providers have the unique opportunity to positively affect the lives of the survivors forever. Most existing advice regarding the needs of families affected by the sudden, unexpected death of a child is based on extrapolations from the hospital setting or on anecdotal evidence. These recommendations are remarkably similar to recommendations regarding the care of families bereaved in other settings, particularly when the deceased is a child.^{46,47}

Ethical concerns regarding the implementation of a termination-of-resuscitation policy deserve mention. Minority populations experience

traumatic injuries disproportionately, including traumatic death. Any termination of resuscitation policy may therefore be viewed with distrust, particularly among minority populations. There are situations in which a family is remote from the scene of the arrest, and transport of the child to a hospital may allow family members more resources for grief counseling. EMS providers may be concerned about child abuse and prefer to transport.⁸⁶ New technologies for resuscitation after cardiopulmonary arrest from various causes are being considered and used at some hospitals, including extracorporeal membrane oxygenation.^{111,112} This technology is expensive and may or may not lead to improved neurologic outcomes in trauma patients.¹¹³ The ability of lay parents to grasp the risks and benefits of this extraordinary treatment option, providing informed consent when they are faced with an emergency life-or-death decision for their child, may be significantly compromised by the urgency of the process. The use of hypothermia as a treatment strategy after traumatic brain injury has also been attempted without a demonstrated survival advantage.¹¹⁴ Preservation of circulation with the specific intent of organ preservation for transplantation is controversial. A specific area of debate that applies to this discussion includes the use of invasive procedures that are nonbeneficial to the donor. Health professionals should remain informed of advances in resuscitation that will allow a balanced discussion with those who will have decision-making authority for a given child.

This literature review and analysis has several limitations. The articles available for review are heterogeneous with respect to etiology of arrest, type of arrest (cardiopulmonary versus

respiratory arrest), and location (out-of-hospital or ED), and final outcome data are often lacking. One study used registry data that may repeat reports of some children previously mentioned in the other studies. There is now an effort to try to standardize data for out-of-hospital arrests that will be helpful going forward, but this information cannot be applied to this review.¹¹⁵ One of the more recent reviews that applied this template excluded trauma patients.⁷⁸ Some of the references in the discussion that detail out-of-hospital cardiac arrest transports to the ED in adults may not necessarily translate to children. The original Hopson study has been reconfirmed, and 1 of the pediatric studies used the same criteria with consistent results,^{66,81} but another group had several survivors when applying the same criteria to an urban population.⁷² As mentioned, some children who undergo CPR in the out-of-hospital setting are unlikely to have been pulseless because of the difficulty of recognizing pulselessness in children.^{60,86} Nevertheless, results of the current review suggest that survival for children suffering an out-of-hospital traumatic cardiopulmonary arrest attributable to blunt or penetrating trauma is poor and that many survivors live with devastating neurologic disability. Despite its limitations, the following conclusions can be proposed on the basis of the results of this review: (1) the retrospective analysis revealed a reported overall traumatic cardiopulmonary arrest survival rate of 5.4%; (2) more recent publications corroborate that a short (<20 minutes) ROSC is associated with improved survival but not necessarily a good outcome; (3) virtually all survivors who require resuscitation for >20 minutes are neurologically devastated, but a few children resuscitated under more favorable circumstances have returned

to baseline; and (4) there are some clear markers that will help identify the rare child who might have a chance at a good outcome. In particular, survivors are likely to have a short interval of arrest to CPR (<5 minutes), to have ROSC in the field within minutes of beginning CPR, and to have sinus rhythm on arrival in the ED. There is little evidence that epinephrine makes a difference in the outcome of trauma patients. Most children with out-of-hospital traumatic cardiopulmonary arrest who receive more than 20 minutes of resuscitation and survive are neurologically devastated. Those who do better receive resuscitation for only a few minutes.

Although most of the recommendations in this statement are at a level 2 or 3 based on the evidence, the decision to withhold resuscitative efforts in a child under specific circumstances (decapitation or dependent lividity, rigor mortis, etc) is reasonable. However, in other circumstances, because of the potential for ambiguity and miscommunication, if there is any doubt as to the circumstances or timing of the traumatic cardiopulmonary arrest, under the current status of limiting termination of resuscitation in the field to persons older than 18 years in most states, resuscitation should be initiated and continued until arrival to the appropriate facility. The decision in these instances should not be left to EMS providers with different levels and variety of training, expertise, experience, and communication skills (even with remote input from the medical director, who is not on-site) to ensure a consistent message is delivered to parents and families of these children. If the patient has arrested and resuscitation has already exceeded 30 minutes and the distance to the nearest facility is more than 30 min-

utes away, involvement of parents and family of these children in the decision-making process with assistance and guidance from medical professionals should be considered as part of an emphasis on family-centered care because evidence suggests that either death or a poor outcome is inevitable.

TREATMENT CONCLUSIONS BASED ON EVIDENCE

1. The withholding of resuscitative efforts should be considered in pediatric victims of penetrating or blunt trauma with injuries obviously incompatible with life, such as decapitation or hemicorporectomy (Level 2).
2. The withholding of resuscitative efforts should be considered in pediatric victims of penetrating or blunt trauma with evidence of a significant time lapse after pulselessness, including dependent lividity, rigor mortis, and decomposition (Level 2).
3. Initiation of standard resuscitation should be considered for cardiopulmonary arrest patients in whom the mechanism of injury does not correlate with a traumatic cause of arrest unless (1) or (2) above applies (Level 2).
4. Initiation of standard resuscitation should be considered in cardiopulmonary arrest victims of lightning strike or drowning in whom there is significant hypothermia unless (1) or (2) applies (Level 2).
5. Immediate transportation to an ED should be considered for children who exhibit witnessed signs of life before traumatic CPR and have CPR ongoing or initiated within 5 minutes in the field, with resuscitation maneuvers including airway management and intravenous or intraosseous line

placement planned during transport (Level 2).

6. After blunt and penetrating trauma in victims in whom there is an unwitnessed traumatic cardiopulmonary arrest, a longer period of hypoxia may be presumed to have occurred, and an acceptable duration of CPR (including bystander CPR) of less than 30 minutes may be considered with medical director input (Level 3).
7. If there is any doubt as to the circumstances or timing of the traumatic cardiopulmonary arrest, under the current status of limiting termination of resuscitation in the field to persons older than 18 years in most states, resuscitation should be initiated and continued until arrival to the appropriate facility (Level 3).
8. The inclusion of children in state termination-of-resuscitation protocols should be considered, including children who are victims of blunt and penetrating trauma who have or in whom there is EMS-witnessed cardiopulmonary arrest and at least 30 minutes of unsuccessful resuscitative efforts, including CPR (Level 2).

FUTURE POLICY AND PROTOCOL GUIDANCE

1. Termination-of-resuscitation protocols for children based on the evidence should be developed and implemented under the guidance of the EMS system or state EMS medical director. Online medical control may be needed to determine the appropriateness of termination of resuscitation in individual children.
2. Policies and procedures for termination-of-resuscitation protocols must include notification of the appropriate law enforcement agencies and notification

of the medical examiner or coroner for final disposition of the body.

3. EMS providers should receive education regarding communication with families and assistance with how to direct families to community and grief resources. EMS providers should have immediate access to resources for their own debriefing and counseling. Families of the deceased should have immediate access to culturally and linguistically appropriate care, counseling, and resources, including access to clergy, social workers, and other counseling personnel.
4. EMS, medical control, and ED providers should have access to resources for their own debriefing and counseling after the death of a child.
5. Adherence to policies and protocols governing termination of resuscitation should be monitored through a quality review system.
6. A more formal study evaluating out-of-hospital traumatic cardiopulmonary arrest that includes long-term neurologic and functional outcome should be performed to clarify expectations for intact survival in children and legitimize the inclusion of children in termination-of-resuscitation protocols.
7. Research is vitally needed regarding the acceptance of termination-of-resuscitation protocols by families of children sustaining out-of-hospital traumatic cardiopulmonary arrest to determine the potential emotional effects of both termination of resuscitation and failure to initiate resuscitative efforts when futility of such efforts is apparent.
8. There is a need for more research and study of infants, children, and adolescents from diverse racial,

ethnic, cultural, and socioeconomic populations to determine whether disparities in resuscitative care or outcomes exist.

9. Engagement of, partnership with, and collaboration with local communities and advocacy groups, perhaps through a community-based participatory research concept, may prove helpful in developing protocols and providing community health education programs about this subject.

2014 RECOMMENDATIONS FOR PEDIATRIC PREVENTIVE HEALTH CARE

Committee on Practice and Ambulatory Medicine and Bright Futures Periodicity Schedule Workgroup (2/14)
See full text on page 471.

AAP PRINCIPLES CONCERNING RETAIL-BASED CLINICS

Committee on Practice and Ambulatory Medicine
ABSTRACT. The American Academy of Pediatrics views retail-based clinics (RBCs) as an inappropriate source of primary care for pediatric patients, as they fragment medical care and are detrimental to the medical home concept of longitudinal and coordinated care. This statement updates the original 2006 American Academy of Pediatrics statement on RBCs, which flatly opposed these sites as appropriate for pediatric care, discussing the shift in RBC focus and comparing attributes of RBCs with those of the pediatric medical home. (2/14)
See full text on page 477.

ABUSIVE HEAD TRAUMA IN INFANTS AND CHILDREN

Cindy W. Christian, MD; Robert Block, MD; and Committee on Child Abuse and Neglect
ABSTRACT. Shaken baby syndrome is a term often used by physicians and the public to describe abusive head trauma inflicted on infants and young children. Although the term is well known and has been used for a number of decades, advances in the understanding of the mechanisms and clinical spectrum of injury associated with abusive head trauma compel us to modify our terminology to keep pace with our understanding of pathologic mechanisms. Although shaking an infant has the potential to cause neurologic injury, blunt impact or a combination of shaking and blunt impact cause injury as well. Spinal cord injury and secondary hypoxic ischemic injury can contribute to poor outcomes of victims. The use of broad medical terminology that is inclusive of all mechanisms of injury, including shaking, is required. The American Academy of Pediatrics recommends that pediatricians develop skills in the recognition of signs and symptoms of abusive head injury, including those caused by both shaking and blunt impact, consult with pediatric subspecialists when necessary, and embrace a less mechanistic term, abusive head trauma, when describing an inflicted injury to the head and its contents. (4/09, reaffirmed 3/13)

ACCESS TO OPTIMAL EMERGENCY CARE FOR CHILDREN

Committee on Pediatric Emergency Medicine
ABSTRACT. Millions of pediatric patients require some level of emergency care annually, and significant barriers limit access to appropriate services for large numbers of children. The American Academy of Pediatrics has a strong commitment to identifying barriers to access to emergency care, working to surmount these obstacles, and encouraging, through education and system changes, improved levels of emergency care available to all children. (1/07, reaffirmed 8/10, 7/14)

ACCF/AHA/AAP RECOMMENDATIONS FOR TRAINING IN PEDIATRIC CARDIOLOGY

American Academy of Pediatrics Section on Cardiology and Cardiac Surgery (joint with American College of Cardiology Foundation and American Heart Association) (12/05, reaffirmed 1/09)

ACHIEVING QUALITY HEALTH SERVICES FOR ADOLESCENTS

Committee on Adolescence
ABSTRACT. In recent years, there has been an increased national focus on assessing and improving the quality of health care. This statement provides recommendations and criteria for assessment of the quality of primary care delivered to adolescents in the United States. Consistent implementation of American Academy of Pediatrics recommendations (periodicity of visits and confidentiality issues), renewed attention to professional quality-improvement activities (access and immunizations) and public education, and modification of existing quality-measurement activities to ensure that quality is delivered are proposed as strategies that would lead to improved care for youth. (6/08, reaffirmed 3/13)

ACTIVE HEALTHY LIVING: PREVENTION OF CHILDHOOD OBESITY THROUGH INCREASED PHYSICAL ACTIVITY

Council on Sports Medicine and Fitness and Council on School Health
ABSTRACT. The current epidemic of inactivity and the associated epidemic of obesity are being driven by multiple factors (societal, technologic, industrial, commercial, financial) and must be addressed likewise on several fronts. Foremost among these are the expansion of school physical education, dissuading children from pursuing sedentary activities, providing suitable role models for physical activity, and making activity-promoting changes in the environment. This statement outlines ways that pediatric health care providers and public health officials

can encourage, monitor, and advocate for increased physical activity for children and teenagers. (5/06, reaffirmed 5/09, 8/12)

ADDITIONAL RECOMMENDATIONS FOR USE OF TETANUS TOXOID, REDUCED-CONTENT DIPHTHERIA TOXOID, AND ACELLULAR PERTUSSIS VACCINE (TDAP)

Committee on Infectious Diseases

ABSTRACT. The American Academy of Pediatrics and the Centers for Disease Control and Prevention are amending previous recommendations and making additional recommendations for the use of tetanus toxoid, reduced-content diphtheria toxoid, and acellular pertussis vaccine (Tdap). Review of the results from clinical trials and other studies has revealed no excess reactogenicity when Tdap is given within a short interval after other tetanus- or diphtheria-containing toxoid products, and accrual of postmarketing adverse-events reports reveals an excellent safety record for Tdap. Thus, the recommendation for caution regarding Tdap use within any interval after a tetanus- or diphtheria-containing toxoid product is removed. Tdap should be given when it is indicated and when no contraindication exists. In further efforts to protect people who are susceptible to pertussis, the American Academy of Pediatrics and Centers for Disease Control and Prevention recommend a single dose of Tdap for children 7 through 10 years of age who were underimmunized with diphtheria-tetanus-acellular pertussis (DTaP). Also, the age for recommendation for Tdap is extended to those aged 65 years and older who have or are likely to have contact with an infant younger than 12 months (eg, health care personnel, grandparents, and other caregivers). (9/11)

ADMISSION AND DISCHARGE GUIDELINES FOR THE PEDIATRIC PATIENT REQUIRING INTERMEDIATE CARE (CLINICAL REPORT)

*Committee on Hospital Care and Section on Critical Care
(joint with Society of Critical Care Medicine)*

ABSTRACT. During the past 3 decades, the specialty of pediatric critical care medicine has grown rapidly, leading to a number of pediatric intensive care units opening across the country. Many patients who are admitted to the hospital require a higher level of care than routine inpatient general pediatric care, yet not to the degree of intensity of pediatric critical care; therefore, an intermediate care level has been developed in institutions providing multidisciplinary subspecialty pediatric care. These patients may require frequent monitoring of vital signs and nursing interventions, but usually they do not require invasive monitoring. The admission of the pediatric intermediate care patient is guided by physiologic parameters depending on the respective organ system involved relative to an institution's resources and capacity to care for a patient in a general care environment. This report provides admission and discharge guidelines for intermediate pediatric care. Intermediate care promotes greater flexibility in patient triage and provides a cost-effective alternative to admission to a pediatric intensive care unit. This level of care may enhance the efficiency of care and make health care more affordable for patients receiving intermediate care. (5/04, reaffirmed 2/08, 1/13)

ADOLESCENT PREGNANCY: CURRENT TRENDS AND ISSUES (CLINICAL REPORT)

Jonathan D. Klein, MD, MPH, and Committee on Adolescence
ABSTRACT. The prevention of unintended adolescent pregnancy is an important goal of the American Academy of Pediatrics and our society. Although adolescent pregnancy and birth rates have been steadily decreasing, many adolescents still become pregnant. Since the last statement on adolescent pregnancy was issued by the Academy in 1998, efforts to prevent adolescent pregnancy have increased, and new observations, technologies, and prevention effectiveness data have emerged. The purpose of this clinical report is to review current trends and issues related to adolescent pregnancy, update practitioners on this topic, and review legal and policy implications of concern to pediatricians. (7/05)

ADOLESCENT PREGNANCY: CURRENT TRENDS AND ISSUES—ADDENDUM

Committee on Adolescence

INTRODUCTION. The purpose of this addendum is to update pediatricians and other professionals on recent research and data regarding adolescent sexuality, contraceptive use, and childbearing since publication of the original 2005 clinical report, "Adolescent Pregnancy: Current Trends and Issues." There has been a trend of decreasing sexual activity and teen births and pregnancies since 1991, except between the years of 2005 and 2007, when there was a 5% increase in birth rates. Currently, teen birth rates in the United States are at a record low secondary to increased use of contraception at first intercourse and use of dual methods of condoms and hormonal contraception among sexually active teenagers. Despite these data, the United States continues to lead other industrialized countries in having unacceptably high rates of adolescent pregnancy, with over 700,000 pregnancies per year, the direct health consequence of unprotected intercourse. Importantly, the 2006–2010 National Survey of Family Growth (NSFG) revealed that less than one-third of 15- to 19-year-old female subjects consistently used contraceptive methods at last intercourse. (4/14)

See full text on page 483.

ADOLESCENTS AND HIV INFECTION: THE PEDIATRICIAN'S ROLE IN PROMOTING ROUTINE TESTING

Committee on Pediatric AIDS

ABSTRACT. Pediatricians can play a key role in preventing and controlling HIV infection by promoting risk-reduction counseling and offering routine HIV testing to adolescent and young adult patients. Most sexually active youth do not feel that they are at risk of contracting HIV and have never been tested. Obtaining a sexual history and creating an atmosphere that promotes nonjudgmental risk counseling is a key component of the adolescent visit. In light of increasing numbers of people with HIV/AIDS and missed opportunities for HIV testing, the Centers for Disease Control and Prevention recommends universal and routine HIV testing for all patients seen in health care settings who are 13 to 64 years of age. There are advances in diagnostics and treatment that help support

this recommendation. This policy statement reviews the epidemiologic data and recommends that routine screening be offered to all adolescents at least once by 16 to 18 years of age in health care settings when the prevalence of HIV in the patient population is more than 0.1%. In areas of lower community HIV prevalence, routine HIV testing is encouraged for all sexually active adolescents and those with other risk factors for HIV. This statement addresses many of the real and perceived barriers that pediatricians face in promoting routine HIV testing for their patients. (10/11)

ADOLESCENTS AND HUMAN IMMUNODEFICIENCY VIRUS INFECTION: THE ROLE OF THE PEDIATRICIAN IN PREVENTION AND INTERVENTION

Committee on Pediatric AIDS and Committee on Adolescence

ABSTRACT. Half of all new human immunodeficiency virus (HIV) infections in the United States occur among young people between the ages of 13 and 24. Sexual transmission accounts for most cases of HIV during adolescence. Pediatricians can play an important role in educating adolescents about HIV prevention, transmission, and testing, with an emphasis on risk reduction, and in advocating for the special needs of adolescents for access to information about HIV. (1/01, reaffirmed 10/03, 1/05)

THE ADOLESCENT'S RIGHT TO CONFIDENTIAL CARE WHEN CONSIDERING ABORTION

Committee on Adolescence

ABSTRACT. In this statement, the American Academy of Pediatrics (AAP) reaffirms its position that the rights of adolescents to confidential care when considering abortion should be protected. The AAP supports the recommendations presented in the report on mandatory parental consent to abortion by the Council on Ethical and Judicial Affairs of the American Medical Association. Adolescents should be strongly encouraged to involve their parents and other trusted adults in decisions regarding pregnancy termination, and the majority of them voluntarily do so. Legislation mandating parental involvement does not achieve the intended benefit of promoting family communication, but it does increase the risk of harm to the adolescent by delaying access to appropriate medical care. The statement presents a summary of pertinent current information related to the benefits and risks of legislation requiring mandatory parental involvement in an adolescent's decision to obtain an abortion. The AAP acknowledges and respects the diversity of beliefs about abortion and affirms the value of voluntary parental involvement in decision making by adolescents. (5/96, reaffirmed 5/99, 11/02)

ADVANCED PRACTICE IN NEONATAL NURSING

Committee on Fetus and Newborn

ABSTRACT. The participation of advanced practice registered nurses in neonatal care continues to be accepted and supported by the American Academy of Pediatrics. Recognized categories of advanced practice neonatal nursing are the neonatal clinical nurse specialist and the neonatal nurse practitioner. (5/09, reaffirmed 1/14)

AGE LIMITS OF PEDIATRICS

Child and Adolescent Health Action Group (5/88, reaffirmed 9/92, 1/97, 3/02, 1/06, 10/11)

AGE TERMINOLOGY DURING THE PERINATAL PERIOD

Committee on Fetus and Newborn

ABSTRACT. Consistent definitions to describe the length of gestation and age in neonates are needed to compare neurodevelopmental, medical, and growth outcomes. The purposes of this policy statement are to review conventional definitions of age during the perinatal period and to recommend use of standard terminology including gestational age, postmenstrual age, chronological age, corrected age, adjusted age, and estimated date of delivery. (11/04, reaffirmed 10/07, 11/08, 1/09, 7/14)

ALCOHOL USE BY YOUTH AND ADOLESCENTS: A PEDIATRIC CONCERN

Committee on Substance Abuse

ABSTRACT. Alcohol use continues to be a major problem from preadolescence through young adulthood in the United States. Results of recent neuroscience research have substantiated the deleterious effects of alcohol on adolescent brain development and added even more evidence to support the call to prevent and reduce underaged drinking. Pediatricians should be knowledgeable about substance abuse to be able to recognize risk factors for alcohol and other substance abuse among youth, screen for use, provide appropriate brief interventions, and refer to treatment. The integration of alcohol use prevention programs in the community and our educational system from elementary school through college should be promoted by pediatricians and the health care community. Promotion of media responsibility to connect alcohol consumption with realistic consequences should be supported by pediatricians. Additional research into the prevention, screening and identification, brief intervention, and management and treatment of alcohol and other substance use by adolescents continues to be needed to improve evidence-based practices. (4/10)

ALLERGY TESTING IN CHILDHOOD: USING ALLERGEN-SPECIFIC IGE TESTS (CLINICAL REPORT)

Scott H. Sicherer, MD; Robert A. Wood, MD; and Section on Allergy and Immunology

ABSTRACT. A variety of triggers can induce common pediatric allergic diseases which include asthma, allergic rhinitis, atopic dermatitis, food allergy, and anaphylaxis. Allergy testing serves to confirm an allergic trigger suspected on the basis of history. Tests for allergen-specific immunoglobulin E (IgE) are performed by in vitro assays or skin tests. The tests are excellent for identifying a sensitized state in which allergen-specific IgE is present, and may identify triggers to be eliminated and help guide immunotherapy treatment. However, a positive test result does not always equate with clinical allergy. Newer enzymatic assays based on anti-IgE antibodies have supplanted the radioallergosorbent test (RAST). This clinical report focuses on allergen-specific IgE testing, emphasizing that the medical history and knowledge of disease characteristics are crucial for rational test selection and interpretation. (12/11)

ALL-TERRAIN VEHICLE INJURY PREVENTION: TWO-, THREE-, AND FOUR-WHEELED UNLICENSED MOTOR VEHICLES

Committee on Injury and Poison Prevention

ABSTRACT. Since 1987, the American Academy of Pediatrics (AAP) has had a policy about the use of motorized cycles and all-terrain vehicles (ATVs) by children. The purpose of this policy statement is to update and strengthen previous policy. This statement describes the various kinds of motorized cycles and ATVs and outlines the epidemiologic characteristics of deaths and injuries related to their use by children in light of the 1987 consent decrees entered into by the US Consumer Product Safety Commission and the manufacturers of ATVs. Recommendations are made for public, patient, and parent education by pediatricians; equipment modifications; the use of safety equipment; and the development and improvement of safer off-road trails and responsive emergency medical systems. In addition, the AAP strengthens its recommendation for passage of legislation in all states prohibiting the use of 2- and 4-wheeled off-road vehicles by children younger than 16 years, as well as a ban on the sale of new and used 3-wheeled ATVs, with a recall of all used 3-wheeled ATVs. (6/00, reaffirmed 5/04, 1/07, 5/13)

AMBIENT AIR POLLUTION: HEALTH HAZARDS TO CHILDREN

Committee on Environmental Health

ABSTRACT. Ambient (outdoor) air pollution is now recognized as an important problem, both nationally and worldwide. Our scientific understanding of the spectrum of health effects of air pollution has increased, and numerous studies are finding important health effects from air pollution at levels once considered safe. Children and infants are among the most susceptible to many of the air pollutants. In addition to associations between air pollution and respiratory symptoms, asthma exacerbations, and asthma hospitalizations, recent studies have found links between air pollution and preterm birth, infant mortality, deficits in lung growth, and possibly, development of asthma. This policy statement summarizes the recent literature linking ambient air pollution to adverse health outcomes in children and includes a perspective on the current regulatory process. The statement provides advice to pediatricians on how to integrate issues regarding air quality and health into patient education and children's environmental health advocacy and concludes with recommendations to the government on promotion of effective air-pollution policies to ensure protection of children's health. (12/04, reaffirmed 4/09)

ANTENATAL COUNSELING REGARDING RESUSCITATION AT AN EXTREMELY LOW GESTATIONAL AGE (CLINICAL REPORT)

Daniel G. Batton, MD, and Committee on Fetus and Newborn

ABSTRACT. The anticipated delivery of an extremely low gestational age infant raises difficult questions for all involved, including whether to initiate resuscitation after delivery. Each institution caring for women at risk of delivering extremely preterm infants should provide comprehensive and consistent guidelines for antenatal counseling. Parents should be provided the most accurate

prognosis possible on the basis of all the factors known to affect outcome for a particular case. Although it is not feasible to have specific criteria for when the initiation of resuscitation should or should not be offered, the following general guidelines are suggested. If the physicians involved believe there is no chance for survival, resuscitation is not indicated and should not be initiated. When a good outcome is considered very unlikely, the parents should be given the choice of whether resuscitation should be initiated, and clinicians should respect their preference. Finally, if a good outcome is considered reasonably likely, clinicians should initiate resuscitation and, together with the parents, continually reevaluate whether intensive care should be continued. Whenever resuscitation is considered an option, a qualified individual, preferably a neonatologist, should be involved and should be present in the delivery room to manage this complex situation. Comfort care should be provided for all infants for whom resuscitation is not initiated or is not successful. (6/09)

ANTERIOR CRUCIATE LIGAMENT INJURIES: DIAGNOSIS, TREATMENT, AND PREVENTION (CLINICAL REPORT)

Cynthia R. LaBella, MD, FAAP; William Hennrikus, MD, FAAP; Timothy E. Hewett, PhD, FACSM; Council on

Sports Medicine and Fitness; and Section on Orthopaedics
ABSTRACT. The number of anterior cruciate ligament (ACL) injuries reported in athletes younger than 18 years has increased over the past 2 decades. Reasons for the increasing ACL injury rate include the growing number of children and adolescents participating in organized sports, intensive sports training at an earlier age, and greater rate of diagnosis because of increased awareness and greater use of advanced medical imaging. ACL injury rates are low in young children and increase sharply during puberty, especially for girls, who have higher rates of noncontact ACL injuries than boys do in similar sports. Intrinsic risk factors for ACL injury include higher BMI, subtalar joint overpronation, generalized ligamentous laxity, and decreased neuromuscular control of knee motion. ACL injuries often require surgery and/or many months of rehabilitation and substantial time lost from school and sports participation. Unfortunately, regardless of treatment, athletes with ACL injuries are up to 10 times more likely to develop degenerative arthritis of the knee. Safe and effective surgical techniques for children and adolescents continue to evolve. Neuromuscular training can reduce risk of ACL injury in adolescent girls. This report outlines the current state of knowledge on epidemiology, diagnosis, treatment, and prevention of ACL injuries in children and adolescents. (4/14)

THE APGAR SCORE

Committee on Fetus and Newborn (joint with American College of Obstetricians and Gynecologists)

ABSTRACT. The Apgar score provides a convenient shorthand for reporting the status of the newborn infant and the response to resuscitation. The Apgar score has been used inappropriately to predict specific neurologic outcome in the term infant. There are no consistent data on the significance of the Apgar score in preterm infants.

The Apgar score has limitations, and it is inappropriate to use it alone to establish the diagnosis of asphyxia. An Apgar score assigned during resuscitation is not equivalent to a score assigned to a spontaneously breathing infant. An expanded Apgar score reporting form will account for concurrent resuscitative interventions and provide information to improve systems of perinatal and neonatal care. (4/06, reaffirmed 1/09)

APPLICATION OF THE RESOURCE-BASED RELATIVE VALUE SCALE SYSTEM TO PEDIATRICS

Committee on Coding and Nomenclature

ABSTRACT. The majority of public and private payers in the United States currently use the Medicare Resource-Based Relative Value Scale as the basis for physician payment. Many large group and academic practices have adopted this objective system of physician work to benchmark physician productivity, including using it, wholly or in part, to determine compensation. The Resource-Based Relative Value Scale survey instrument, used to value physician services, was designed primarily for procedural services, leading to current concerns that American Medical Association/Specialty Society Relative Value Scale Update Committee (RUC) surveys may undervalue nonprocedural evaluation and management services. The American Academy of Pediatrics is represented on the RUC, the committee charged with maintaining accurate physician work values across specialties and age groups. The Academy, working closely with other primary care and subspecialty societies, actively pursues a balanced RUC membership and a survey instrument that will ensure appropriate work relative value unit assignments, thereby allowing pediatricians to receive appropriate payment for their services relative to other services. (5/14)

See full text on page 505.

ASSESSMENT AND MANAGEMENT OF INGUINAL HERNIA IN INFANTS (CLINICAL REPORT)

Kasper S. Wang, MD; Committee on Fetus and Newborn; and Section on Surgery

ABSTRACT. Inguinal hernia repair in infants is a routine surgical procedure. However, numerous issues, including timing of the repair, the need to explore the contralateral groin, use of laparoscopy, and anesthetic approach, remain unsettled. Given the lack of compelling data, consideration should be given to large, prospective, randomized controlled trials to determine best practices for the management of inguinal hernias in infants. (9/12)

ATHLETIC PARTICIPATION BY CHILDREN AND ADOLESCENTS WHO HAVE SYSTEMIC HYPERTENSION

Rebecca A. Demorest, MD; Reginald L. Washington, MD; and Council on Sports Medicine and Fitness

ABSTRACT. Children and adolescents who have hypertension may be at risk for complications when exercise causes their blood pressure to rise even higher. The purpose of this statement is to update recommendations concerning the athletic participation of individuals with hypertension, including special populations such as those with spinal cord injuries or obesity, by using the guidelines from "The 36th Bethesda Conference: Eligibility Recommendations for Competitive Athletes

with Cardiovascular Abnormalities"; "The Fourth Report on the Diagnosis, Evaluation, and Treatment of High Blood Pressure in Children and Adolescents"; and "The Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure." (5/10, reaffirmed 5/13)

ATOPIC DERMATITIS: SKIN-DIRECTED MANAGEMENT (CLINICAL REPORT)

Megha M. Tollefson, MD; Anna L. Bruckner, MD, FAAP; Section on Dermatology

ABSTRACT. Atopic dermatitis is a common inflammatory skin condition characterized by relapsing eczematous lesions in a typical distribution. It can be frustrating for pediatric patients, parents, and health care providers alike. The pediatrician will treat the majority of children with atopic dermatitis as many patients will not have access to a pediatric medical subspecialist, such as a pediatric dermatologist or pediatric allergist. This report provides up-to-date information regarding the disease and its impact, pathogenesis, treatment options, and potential complications. The goal of this report is to assist pediatricians with accurate and useful information that will improve the care of patients with atopic dermatitis. (11/14)

See full text on page 513.

ATTENTION-DEFICIT/HYPERACTIVITY DISORDER AND SUBSTANCE ABUSE (CLINICAL REPORT)

Elizabeth Harstad, MD, MPH, FAAP; Sharon Levy, MD, MPH, FAAP; and Committee on Substance Abuse

ABSTRACT. Attention-deficit/hyperactivity disorder (ADHD) and substance use disorders are inextricably intertwined. Children with ADHD are more likely than peers to develop substance use disorders. Treatment with stimulants may reduce the risk of substance use disorders, but stimulants are a class of medication with significant abuse and diversion potential. The objectives of this clinical report were to present practical strategies for reducing the risk of substance use disorders in patients with ADHD and suggestions for safe stimulant prescribing. (6/14)

See full text on page 525.

AUDITORY INTEGRATION TRAINING AND FACILITATED COMMUNICATION FOR AUTISM

Committee on Children With Disabilities

ABSTRACT. This statement reviews the basis for two new therapies for autism—auditory integration training and facilitative communication. Both therapies seek to improve communication skills. Currently available information does not support the claims of proponents that these treatments are efficacious. Their use does not appear warranted at this time, except within research protocols. (8/98, reaffirmed 5/02, 1/06, 12/09)

BASEBALL AND SOFTBALL

Council on Sports Medicine and Fitness

ABSTRACT. Baseball and softball are among the most popular and safest sports in which children and adolescents participate. Nevertheless, traumatic and overuse injuries occur regularly, including occasional catastrophic injury and even death. Safety of the athlete is a constant focus of attention among those responsible for modifying rules. Understanding the stresses placed on the arm, espe-

cially while pitching, led to the institution of rules controlling the quantity of pitches thrown in youth baseball and established rest periods between pitching assignments. Similarly, field maintenance and awareness of environmental conditions as well as equipment maintenance and creative prevention strategies are critically important in minimizing the risk of injury. This statement serves as a basis for encouraging safe participation in baseball and softball. This statement has been endorsed by the Canadian Paediatric Society. (2/12)

BICYCLE HELMETS

Committee on Injury and Poison Prevention

ABSTRACT. Bicycling remains one of the most popular recreational sports among children in America and is the leading cause of recreational sports injuries treated in emergency departments. An estimated 23 000 children younger than 21 years sustained head injuries (excluding the face) while bicycling in 1998. The bicycle helmet is a very effective device that can prevent the occurrence of up to 88% of serious brain injuries. Despite this, most children do not wear a helmet each time they ride a bicycle, and adolescents are particularly resistant to helmet use. Recently, a group of national experts and government agencies renewed the call for all bicyclists to wear helmets. This policy statement describes the role of the pediatrician in helping attain universal helmet use among children and teens for each bicycle ride. (10/01, reaffirmed 1/05, 2/08, 11/11)

BONE DENSITOMETRY IN CHILDREN AND ADOLESCENTS (CLINICAL REPORT)

Laura K. Bachrach, MD; Irene N. Sills, MD; and Section on Endocrinology

ABSTRACT. Concern for bone fragility in children and adolescents has led to increased interest in bone densitometry. Pediatric patients with genetic and acquired chronic diseases, immobility, and inadequate nutrition may fail to achieve the expected gains in bone size, mass, and strength, which leaves them vulnerable to fracture. In older adults, bone densitometry has been shown to predict fracture risk and reflect response to therapy. The role of densitometry in the management of children at risk of bone fragility is less certain. This clinical report summarizes the current knowledge about bone densitometry in the pediatric population, including indications for its use, interpretation of results, and its risks and costs. This report emphasizes consensus statements generated at the 2007 Pediatric Position Development Conference of the International Society of Clinical Densitometry by an international panel of bone experts. Some of these recommendations are evidence-based, and others reflect expert opinion, because the available data are inadequate. The statements from this and other expert panels have provided general guidance to the pediatrician, but decisions about ordering and interpreting bone densitometry still require clinical judgment. Ongoing studies will help to better define the indications and best methods for assessing bone strength in children and the clinical factors that contribute to fracture risk. (12/10)

BOXING PARTICIPATION BY CHILDREN AND ADOLESCENTS

Council on Sports Medicine and Fitness (joint with Canadian Paediatric Society Healthy Active Living and Sports Medicine Committee)

ABSTRACT. Thousands of boys and girls younger than 19 years participate in boxing in North America. Although boxing provides benefits for participants, including exercise, self-discipline, and self-confidence, the sport of boxing encourages and rewards deliberate blows to the head and face. Participants in boxing are at risk of head, face, and neck injuries, including chronic and even fatal neurologic injuries. Concussions are one of the most common injuries that occur with boxing. Because of the risk of head and facial injuries, the American Academy of Pediatrics and the Canadian Paediatric Society oppose boxing as a sport for children and adolescents. These organizations recommend that physicians vigorously oppose boxing in youth and encourage patients to participate in alternative sports in which intentional head blows are not central to the sport. (8/11)

BREASTFEEDING AND THE USE OF HUMAN MILK

Section on Breastfeeding

ABSTRACT. Breastfeeding and human milk are the normative standards for infant feeding and nutrition. Given the documented short- and long-term medical and neurodevelopmental advantages of breastfeeding, infant nutrition should be considered a public health issue and not only a lifestyle choice. The American Academy of Pediatrics reaffirms its recommendation of exclusive breastfeeding for about 6 months, followed by continued breastfeeding as complementary foods are introduced, with continuation of breastfeeding for 1 year or longer as mutually desired by mother and infant. Medical contraindications to breastfeeding are rare. Infant growth should be monitored with the World Health Organization (WHO) Growth Curve Standards to avoid mislabeling infants as underweight or failing to thrive. Hospital routines to encourage and support the initiation and sustaining of exclusive breastfeeding should be based on the American Academy of Pediatrics-endorsed WHO/UNICEF "Ten Steps to Successful Breastfeeding." National strategies supported by the US Surgeon General's Call to Action, the Centers for Disease Control and Prevention, and The Joint Commission are involved to facilitate breastfeeding practices in US hospitals and communities. Pediatricians play a critical role in their practices and communities as advocates of breastfeeding and thus should be knowledgeable about the health risks of not breastfeeding, the economic benefits to society of breastfeeding, and the techniques for managing and supporting the breastfeeding dyad. The "Business Case for Breastfeeding" details how mothers can maintain lactation in the workplace and the benefits to employers who facilitate this practice. (2/12)

THE BUILT ENVIRONMENT: DESIGNING COMMUNITIES TO PROMOTE PHYSICAL ACTIVITY IN CHILDREN

Committee on Environmental Health

ABSTRACT. An estimated 32% of American children are overweight, and physical inactivity contributes to this high prevalence of overweight. This policy statement highlights how the built environment of a community affects children's opportunities for physical activity. Neighborhoods and communities can provide opportunities for recreational physical activity with parks and open spaces, and policies must support this capacity. Children can engage in physical activity as a part of their daily lives, such as on their travel to school. Factors such as school location have played a significant role in the decreased rates of walking to school, and changes in policy may help to increase the number of children who are able to walk to school. Environment modification that addresses risks associated with automobile traffic is likely to be conducive to more walking and biking among children. Actions that reduce parental perception and fear of crime may promote outdoor physical activity. Policies that promote more active lifestyles among children and adolescents will enable them to achieve the recommended 60 minutes of daily physical activity. By working with community partners, pediatricians can participate in establishing communities designed for activity and health. (5/09, reaffirmed 1/13)

CALCIUM AND VITAMIN D REQUIREMENTS OF ENTERALLY FED PRETERM INFANTS (CLINICAL REPORT)

Steven A. Abrams, MD, and Committee on Nutrition

ABSTRACT. Bone health is a critical concern in managing preterm infants. Key nutrients of importance are calcium, vitamin D, and phosphorus. Although human milk is critical for the health of preterm infants, it is low in these nutrients relative to the needs of the infants during growth. Strategies should be in place to fortify human milk for preterm infants with birth weight <1800 to 2000 g and to ensure adequate mineral intake during hospitalization and after hospital discharge. Biochemical monitoring of very low birth weight infants should be performed during their hospitalization. Vitamin D should be provided at 200 to 400 IU/day both during hospitalization and after discharge from the hospital. Infants with radiologic evidence of rickets should have efforts made to maximize calcium and phosphorus intake by using available commercial products and, if needed, direct supplementation with these minerals. (4/13)

CARDIOVASCULAR HEALTH SUPERVISION FOR INDIVIDUALS AFFECTED BY DUCHENNE OR BECKER MUSCULAR DYSTROPHY (CLINICAL REPORT)

Section on Cardiology and Cardiac Surgery

ABSTRACT. Duchenne muscular dystrophy is the most common and severe form of the childhood muscular dystrophies. The disease is typically diagnosed between 3 and 7 years of age and follows a predictable clinical course marked by progressive skeletal muscle weakness with loss of ambulation by 12 years of age. Death occurs in early adulthood secondary to respiratory or cardiac failure. Becker muscular dystrophy is less common and has

a milder clinical course but also results in respiratory and cardiac failure. The natural history of the cardiomyopathy in these diseases has not been well established. As a result, patients traditionally present for cardiac evaluation only after clinical symptoms become evident. The purpose of this policy statement is to provide recommendations for optimal cardiovascular evaluation to health care specialists caring for individuals in whom the diagnosis of Duchenne or Becker muscular dystrophy has been confirmed. (12/05, reaffirmed 1/09)

CARDIOVASCULAR MONITORING AND STIMULANT DRUGS FOR ATTENTION-DEFICIT/HYPERACTIVITY DISORDER

James M. Perrin, MD; Richard A. Friedman, MD; Timothy K. Knillans, MD; Black Box Working Group; and Section on Cardiology and Cardiac Surgery

ABSTRACT. A recent American Heart Association (AHA) statement recommended electrocardiograms (ECGs) routinely for children before they start medications to treat attention-deficit/hyperactivity disorder (ADHD). The AHA statement reflected the thoughtful work of a group committed to improving the health of children with heart disease. However, the recommendation to obtain an ECG before starting medications for treating ADHD contradicts the carefully considered and evidence-based recommendations of the American Academy of Child and Adolescent Psychiatry and the American Academy of Pediatrics (AAP). These organizations have concluded that sudden cardiac death (SCD) in persons taking medications for ADHD is a very rare event, occurring at rates no higher than those in the general population of children and adolescents. Both of these groups also noted the lack of any evidence that the routine use of ECG screening before beginning medication for ADHD treatment would prevent sudden death. The AHA statement pointed out the importance of detecting silent but clinically important cardiac conditions in children and adolescents, which is a goal that the AAP shares. The primary purpose of the AHA statement is to prevent cases of SCD that may be related to stimulant medications. The recommendations of the AAP and the rationale for these recommendations are the subject of this statement. (8/08)

CARE COORDINATION IN THE MEDICAL HOME: INTEGRATING HEALTH AND RELATED SYSTEMS OF CARE FOR CHILDREN WITH SPECIAL HEALTH CARE NEEDS

Council on Children With Disabilities

ABSTRACT. Care coordination is a process that facilitates the linkage of children and their families with appropriate services and resources in a coordinated effort to achieve good health. Care coordination for children with special health care needs often is complicated because there is no single point of entry into the multiple systems of care, and complex criteria frequently determine the availability of funding and services among public and private payers. Economic and sociocultural barriers to coordination of care exist and affect families and health care professionals. In their important role of providing a medical home for all children, primary care physicians have a vital role in the process of care coordination, in concert with the family. (11/05)

CARE OF ADOLESCENT PARENTS AND THEIR CHILDREN (CLINICAL REPORT)

Jorge L. Pinzon, MD; Veronnie F. Jones, MD; Committee on Adolescence; and Committee on Early Childhood

ABSTRACT. Teen pregnancy and parenting remain an important public health issue in the United States and the world, and many children live with their adolescent parents alone or as part of an extended family. A significant proportion of teen parents reside with their family of origin, significantly affecting the multigenerational family structure. Repeated births to teen parents are also common. This clinical report updates a previous policy statement on care of the adolescent parent and their children and addresses medical and psychosocial risks specific to this population. Challenges unique to teen parents and their children are reviewed, along with suggestions for the pediatrician on models for intervention and care. (11/12)

CARE OF THE ADOLESCENT SEXUAL ASSAULT VICTIM (CLINICAL REPORT)

Miriam Kaufman, MD, and Committee on Adolescence

ABSTRACT. Sexual assault is a broad-based term that encompasses a wide range of sexual victimizations including rape. Since the American Academy of Pediatrics published its last policy statement on sexual assault in 2001, additional information and data have emerged about sexual assault and rape in adolescents and the treatment and management of the adolescent who has been a victim of sexual assault. This report provides new information to update physicians and focuses on assessment and care of sexual assault victims in the adolescent population. (8/08)

CAREGIVER-FABRICATED ILLNESS IN A CHILD: A MANIFESTATION OF CHILD MALTREATMENT (CLINICAL REPORT)

Emalee G. Flaherty, MD; Harriet L. MacMillan, MD; and Committee on Child Abuse and Neglect

ABSTRACT. Caregiver-fabricated illness in a child is a form of child maltreatment caused by a caregiver who falsifies and/or induces a child's illness, leading to unnecessary and potentially harmful medical investigations and/or treatment. This condition can result in significant morbidity and mortality. Although caregiver-fabricated illness in a child has been widely known as Munchausen syndrome by proxy, there is ongoing discussion about alternative names, including pediatric condition falsification, factitious disorder (illness) by proxy, child abuse in the medical setting, and medical child abuse. Because it is a relatively uncommon form of maltreatment, pediatricians need to have a high index of suspicion when faced with a persistent or recurrent illness that cannot be explained and that results in multiple medical procedures or when there are discrepancies between the history, physical examination, and health of a child. This report updates the previous clinical report "Beyond Munchausen Syndrome by Proxy: Identification and Treatment of Child Abuse in the Medical Setting." The authors discuss the need to agree on appropriate terminology, provide an update on published reports of new manifestations of fabricated medical conditions, and discuss approaches to assessment, diagnosis, and management, including how best to protect the child from further harm. (8/13)

THE CHANGING CONCEPT OF SUDDEN INFANT DEATH SYNDROME: DIAGNOSTIC CODING SHIFTS, CONTROVERSIES REGARDING THE SLEEPING ENVIRONMENT, AND NEW VARIABLES TO CONSIDER IN REDUCING RISK

Task Force on Sudden Infant Death Syndrome

ABSTRACT. There has been a major decrease in the incidence of sudden infant death syndrome (SIDS) since the American Academy of Pediatrics (AAP) released its recommendation in 1992 that infants be placed down for sleep in a nonprone position. Although the SIDS rate continues to fall, some of the recent decrease of the last several years may be a result of coding shifts to other causes of unexpected infant deaths. Since the AAP published its last statement on SIDS in 2000, several issues have become relevant, including the significant risk of side sleeping position; the AAP no longer recognizes side sleeping as a reasonable alternative to fully supine sleeping. The AAP also stresses the need to avoid redundant soft bedding and soft objects in the infant's sleeping environment, the hazards of adults sleeping with an infant in the same bed, the SIDS risk reduction associated with having infants sleep in the same room as adults and with using pacifiers at the time of sleep, the importance of educating secondary caregivers and neonatology practitioners on the importance of "back to sleep," and strategies to reduce the incidence of positional plagiocephaly associated with supine positioning. This statement reviews the evidence associated with these and other SIDS-related issues and proposes new recommendations for further reducing SIDS risk. (11/05, reaffirmed 5/08)

CHEERLEADING INJURIES: EPIDEMIOLOGY AND RECOMMENDATIONS FOR PREVENTION

Council on Sports Medicine and Fitness

ABSTRACT. Over the last 30 years, cheerleading has increased dramatically in popularity and has evolved from leading the crowd in cheers at sporting events into a competitive, year-round sport involving complex acrobatic stunts and tumbling. Consequently, cheerleading injuries have steadily increased over the years in both number and severity. Sprains and strains to the lower extremities are the most common injuries. Although the overall injury rate remains relatively low, cheerleading has accounted for approximately 66% of all catastrophic injuries in high school girl athletes over the past 25 years. Risk factors for injuries in cheerleading include higher BMI, previous injury, cheering on harder surfaces, performing stunts, and supervision by a coach with low level of training and experience. This policy statement describes the epidemiology of cheerleading injuries and provides recommendations for injury prevention. (10/12)

CHEMICAL-BIOLOGICAL TERRORISM AND ITS IMPACT ON CHILDREN

Committee on Environmental Health and Committee on Infectious Diseases

ABSTRACT. Children remain potential victims of chemical or biological terrorism. In recent years, children have even been specific targets of terrorist acts. Consequently, it is necessary to address the needs that children would face after a terrorist incident. A broad range of public health initiatives have occurred since September 11, 2001.

Although the needs of children have been addressed in many of them, in many cases, these initiatives have been inadequate in ensuring the protection of children. In addition, public health and health care system preparedness for terrorism has been broadened to the so-called all-hazards approach, in which response plans for terrorism are blended with plans for a public health or health care system response to unintentional disasters (eg, natural events such as earthquakes or pandemic flu or manmade catastrophes such as a hazardous-materials spill). In response to new principles and programs that have appeared over the last 5 years, this policy statement provides an update of the 2000 policy statement. The roles of both the pediatrician and public health agencies continue to be emphasized; only a coordinated effort by pediatricians and public health can ensure that the needs of children, including emergency protocols in schools or child care centers, decontamination protocols, and mental health interventions, will be successful. (9/06, reaffirmed 1/11)

CHEMICAL-MANAGEMENT POLICY: PRIORITIZING CHILDREN'S HEALTH

Council on Environmental Health

ABSTRACT. The American Academy of Pediatrics recommends that chemical-management policy in the United States be revised to protect children and pregnant women and to better protect other populations. The Toxic Substance Control Act (TSCA) was passed in 1976. It is widely recognized to have been ineffective in protecting children, pregnant women, and the general population from hazardous chemicals in the marketplace. It does not take into account the special vulnerabilities of children in attempting to protect the population from chemical hazards. Its processes are so cumbersome that in its more than 30 years of existence, the TSCA has been used to regulate only 5 chemicals or chemical classes of the tens of thousands of chemicals that are in commerce. Under the TSCA, chemical companies have no responsibility to perform premarket testing or postmarket follow-up of the products that they produce; in fact, the TSCA contains disincentives for the companies to produce such data. Voluntary programs have been inadequate in resolving problems. Therefore, chemical-management policy needs to be rewritten in the United States. Manufacturers must be responsible for developing information about chemicals before marketing. The US Environmental Protection Agency must have the authority to demand additional safety data about a chemical and to limit or stop the marketing of a chemical when there is a high degree of suspicion that the chemical might be harmful to children, pregnant women, or other populations. (4/11)

CHILD ABUSE, CONFIDENTIALITY, AND THE HEALTH INSURANCE PORTABILITY AND ACCOUNTABILITY ACT

Committee on Child Abuse and Neglect

ABSTRACT. The federal Health Insurance Portability and Accountability Act (HIPAA) of 1996 has significantly affected clinical practice, particularly with regard to how patient information is shared. HIPAA addresses the security and privacy of patient health data, ensuring that information is released appropriately with patient or guardian

consent and knowledge. However, when child abuse or neglect is suspected in a clinical setting, the physician may determine that release of information without consent is necessary to ensure the health and safety of the child. This policy statement provides an overview of HIPAA regulations with regard to the role of the pediatrician in releasing or reviewing patient health information when the patient is a child who is a suspected victim of abuse or neglect. This statement is based on the most current regulations provided by the US Department of Health and Human Services and is subject to future changes and clarifications as updates are provided. (12/09, reaffirmed 1/14)

CHILD FATALITY REVIEW

Cindy W. Christian, MD; Robert D. Sege, MD, PhD;

Committee on Child Abuse and Neglect; Committee on Injury, Violence, and Poison Prevention; and Council on Community Pediatrics

ABSTRACT. Injury remains the leading cause of pediatric mortality and requires public health approaches to reduce preventable deaths. Child fatality review teams, first established to review suspicious child deaths involving abuse or neglect, have expanded toward a public health model of prevention of child fatality through systematic review of child deaths from birth through adolescence. Approximately half of all states report reviewing child deaths from all causes, and the process of fatality review has identified effective local and state prevention strategies for reducing child deaths. This expanded approach can be a powerful tool in understanding the epidemiology and preventability of child death locally, regionally, and nationally; improving accuracy of vital statistics data; and identifying public health and legislative strategies for reducing preventable child fatalities. The American Academy of Pediatrics supports the development of federal and state legislation to enhance the child fatality review process and recommends that pediatricians become involved in local and state child death reviews. (8/10, reaffirmed 5/14)

CHILD LIFE SERVICES

Committee on Hospital Care and Child Life Council

ABSTRACT. Child life programs are an important component of pediatric hospital-based care to address the psychosocial concerns that accompany hospitalization and other health care experiences. Child life specialists focus on the optimal development and well-being of infants, children, adolescents, and young adults while promoting coping skills and minimizing the adverse effects of hospitalization, health care, and/or other potentially stressful experiences. Using therapeutic play, expressive modalities, and psychological preparation as primary tools, in collaboration with the entire health care team and family, child life interventions facilitate coping and adjustment at times and under circumstances that might otherwise prove overwhelming for the child. Play and developmentally appropriate communication are used to: (1) promote optimal development; (2) educate children and families about health conditions; (3) prepare children and families for medical events or procedures; (4) plan and rehearse useful coping and pain management strategies; (5) help children work through feelings about past or impending

experiences; and (6) establish therapeutic relationships with patients, siblings, and parents to support family involvement in each child's care. (4/14)

See full text on page 537.

CHILD PASSENGER SAFETY

*Committee on Injury, Violence,
and Poison Prevention*

ABSTRACT. Child passenger safety has dramatically evolved over the past decade; however, motor vehicle crashes continue to be the leading cause of death of children 4 years and older. This policy statement provides 4 evidence-based recommendations for best practices in the choice of a child restraint system to optimize safety in passenger vehicles for children from birth through adolescence: (1) rear-facing car safety seats for most infants up to 2 years of age; (2) forward-facing car safety seats for most children through 4 years of age; (3) belt-positioning booster seats for most children through 8 years of age; and (4) lap-and-shoulder seat belts for all who have outgrown booster seats. In addition, a fifth evidence-based recommendation is for all children younger than 13 years to ride in the rear seats of vehicles. It is important to note that every transition is associated with some decrease in protection; therefore, parents should be encouraged to delay these transitions for as long as possible. These recommendations are presented in the form of an algorithm that is intended to facilitate implementation of the recommendations by pediatricians to their patients and families and should cover most situations that pediatricians will encounter in practice. The American Academy of Pediatrics urges all pediatricians to know and promote these recommendations as part of child passenger safety anticipatory guidance at every health-supervision visit. (3/11)

CHILD PASSENGER SAFETY (TECHNICAL REPORT)

Dennis R. Durbin, MD, MSCE,

and Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Despite significant reductions in the number of children killed in motor vehicle crashes over the past decade, crashes continue to be the leading cause of death for children 4 years and older. Therefore, the American Academy of Pediatrics continues to recommend inclusion of child passenger safety anticipatory guidance at every health-supervision visit. This technical report provides a summary of the evidence in support of 5 recommendations for best practices to optimize safety in passenger vehicles for children from birth through adolescence that all pediatricians should know and promote in their routine practice. These recommendations are presented in the revised policy statement on child passenger safety in the form of an algorithm that is intended to facilitate their implementation by pediatricians with their patients and families. The algorithm is designed to cover the majority of situations that pediatricians will encounter in practice. In addition, a summary of evidence on a number of additional issues that affect the safety of children in motor vehicles, including the proper use and installation of child restraints, exposure to air bags, travel in pickup trucks,

children left in or around vehicles, and the importance of restraint laws, is provided. Finally, this technical report provides pediatricians with a number of resources for additional information to use when providing anticipatory guidance to families. (3/11)

CHILDREN, ADOLESCENTS, AND ADVERTISING

Committee on Communications

ABSTRACT. Advertising is a pervasive influence on children and adolescents. Young people view more than 40 000 ads per year on television alone and increasingly are being exposed to advertising on the Internet, in magazines, and in schools. This exposure may contribute significantly to childhood and adolescent obesity, poor nutrition, and cigarette and alcohol use. Media education has been shown to be effective in mitigating some of the negative effects of advertising on children and adolescents. (12/06, reaffirmed 3/10)

CHILDREN, ADOLESCENTS, AND TELEVISION

Committee on Public Education

ABSTRACT. This statement describes the possible negative health effects of television viewing on children and adolescents, such as violent or aggressive behavior, substance use, sexual activity, obesity, poor body image, and decreased school performance. In addition to the television ratings system and the v-chip (electronic device to block programming), media education is an effective approach to mitigating these potential problems. The American Academy of Pediatrics offers a list of recommendations on this issue for pediatricians and for parents, the federal government, and the entertainment industry. (2/01)

CHILDREN, ADOLESCENTS, AND THE MEDIA

Council on Communications and Media

ABSTRACT. Media, from television to the "new media" (including cell phones, iPads, and social media), are a dominant force in children's lives. Although television is still the predominant medium for children and adolescents, new technologies are increasingly popular. The American Academy of Pediatrics continues to be concerned by evidence about the potential harmful effects of media messages and images; however, important positive and prosocial effects of media use should also be recognized. Pediatricians are encouraged to take a media history and ask 2 media questions at every well-child visit: How much recreational screen time does your child or teenager consume daily? Is there a television set or Internet-connected device in the child's bedroom? Parents are encouraged to establish a family home use plan for all media. Media influences on children and teenagers should be recognized by schools, policymakers, product advertisers, and entertainment producers. (10/13)

CHILDREN, ADOLESCENTS, OBESITY, AND THE MEDIA

Council on Communications and Media

ABSTRACT. Obesity has become a worldwide public health problem. Considerable research has shown that the media contribute to the development of child and adolescent obesity, although the exact mechanism remains

unclear. Screen time may displace more active pursuits, advertising of junk food and fast food increases children's requests for those particular foods and products, snacking increases while watching TV or movies, and late-night screen time may interfere with getting adequate amounts of sleep, which is a known risk factor for obesity. Sufficient evidence exists to warrant a ban on junk-food or fast-food advertising in children's TV programming. Pediatricians need to ask 2 questions about media use at every well-child or well-adolescent visit: (1) How much screen time is being spent per day? and (2) Is there a TV set or Internet connection in the child's bedroom? (7/11)

CHILDREN, ADOLESCENTS, SUBSTANCE ABUSE, AND THE MEDIA

Victor C. Strasburger, MD, and Council on Communications and Media

ABSTRACT. The causes of adolescent substance use are multifactorial, but the media can play a key role. Tobacco and alcohol represent the 2 most significant drug threats to adolescents. More than \$25 billion per year is spent on advertising for tobacco, alcohol, and prescription drugs, and such advertising has been shown to be effective. Digital media are increasingly being used to advertise drugs. In addition, exposure to PG-13- and R-rated movies at an early age may be a major factor in the onset of adolescent tobacco and alcohol use. The American Academy of Pediatrics recommends a ban on all tobacco advertising in all media, limitations on alcohol advertising, avoiding exposure of young children to substance-related (tobacco, alcohol, prescription drugs, illegal drugs) content on television and in PG-13- and R-rated movies, incorporating the topic of advertising and media into all substance abuse-prevention programs, and implementing media education programs in the classroom. (9/10)

CHILDREN AS HEMATOPOIETIC STEM CELL DONORS

Committee on Bioethics

ABSTRACT. In the past half-century, hematopoietic stem cell transplantation has become standard treatment for a variety of diseases in children and adults, including selected hematologic malignancies, immunodeficiencies, hemoglobinopathies, bone marrow failure syndromes, and congenital metabolic disorders. There are 3 sources of allogeneic hematopoietic stem cells: bone marrow, peripheral blood, and umbilical cord blood; each has its own benefits and risks. Children often serve as hematopoietic stem cell donors, most commonly for their siblings. HLA-matched biological siblings are generally preferred as donors because of reduced risks of transplant-related complications as compared with unrelated donors. This statement includes a discussion of the ethical considerations regarding minors serving as stem cell donors, using the traditional benefit/burden calculation from the perspectives of both the donor and the recipient. The statement also includes an examination of the circumstances under which a minor may ethically participate as a hematopoietic stem cell donor, how the risks can be minimized, what the informed-consent process should entail, the role for a donor advocate (or some similar mechanism), and other ethical concerns. The American Academy of

Pediatrics holds that minors can ethically serve as stem cell donors when specific criteria are fulfilled. (1/10)

CHILDREN IN PICKUP TRUCKS

Committee on Injury and Poison Prevention

ABSTRACT. Pickup trucks have become increasingly popular in the United States. A recent study found that in crashes involving fatalities, cargo area passengers were 3 times more likely to die than were occupants in the cab. Compared with restrained cab occupants, the risk of death for those in the cargo area was 8 times higher. Furthermore, the increased use of extended-cab pickup trucks and air bag-equipped front passenger compartments creates concerns about the safe transport of children. The most effective preventive strategies are the legislative prohibition of travel in the cargo area and requirements for age-appropriate restraint use and seat selection in the cab. Parents should select vehicles that are appropriate for the safe transportation needs of the family. Physicians have an important role in counseling families and advocating public policy measures to reduce the number of deaths and injuries to occupants of pickup trucks. (10/00, reaffirmed 5/04, 1/07)

CHILDREN'S HEALTH INSURANCE PROGRAM (CHIP): ACCOMPLISHMENTS, CHALLENGES, AND POLICY RECOMMENDATIONS

Committee on Child Health Financing

ABSTRACT. Sixteen years ago, the 105th Congress, responding to the needs of 10 million children in the United States who lacked health insurance, created the State Children's Health Insurance Program (SCHIP) as part of the Balanced Budget Act of 1997. Enacted as Title XXI of the Social Security Act, the Children's Health Insurance Program (CHIP; or SCHIP as it has been known at some points) provided states with federal assistance to create programs specifically designed for children from families with incomes that exceeded Medicaid thresholds but that were insufficient to enable them to afford private health insurance. Congress provided \$40 billion in block grants over 10 years for states to expand their existing Medicaid programs to cover the intended populations, to erect new stand-alone SCHIP programs for these children, or to effect some combination of both options. Congress reauthorized CHIP once in 2009 under the Children's Health Insurance Program Reauthorization Act and extended its life further within provisions of the Patient Protection and Affordable Care Act of 2010. The purpose of this statement is to review the features of CHIP as it has evolved over the 16 years of its existence; to summarize what is known about the effects that the program has had on coverage, access, health status, and disparities among participants; to identify challenges that remain with respect to insuring this group of vulnerable children, including the impact that provisions of the new Affordable Care Act will have on the issue of health insurance coverage for near-poor children after 2015; and to offer recommendations on how to expand and strengthen the national commitment to provide health insurance to all children regardless of means. (2/14)

CHRONIC ABDOMINAL PAIN IN CHILDREN (CLINICAL REPORT)

Steering Committee on Quality Improvement and Management and Subcommittee on Chronic Abdominal Pain (joint with North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition)

ABSTRACT. Children and adolescents with chronic abdominal pain pose unique challenges to their caregivers. Affected children and their families experience distress and anxiety that can interfere with their ability to perform regular daily activities. Although chronic abdominal pain in children is usually attributable to a functional disorder rather than organic disease, numerous misconceptions, insufficient knowledge among health care professionals, and inadequate application of knowledge may contribute to a lack of effective management. This clinical report accompanies a technical report (see page e370 in this issue) on childhood chronic abdominal pain and provides guidance for the clinician in the evaluation and treatment of children with chronic abdominal pain. The recommendations are based on the evidence reviewed in the technical report and on consensus achieved among subcommittee members. (3/05)

CHRONIC ABDOMINAL PAIN IN CHILDREN (TECHNICAL REPORT)

Steering Committee on Quality Improvement and Management and Subcommittee on Chronic Abdominal Pain (joint with North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition)

ABSTRACT. Chronic abdominal pain, defined as long-lasting intermittent or constant abdominal pain, is a common pediatric problem encountered by primary care physicians, medical subspecialists, and surgical specialists. Chronic abdominal pain in children is usually functional, that is, without objective evidence of an underlying organic disorder. The Subcommittee on Chronic Abdominal Pain of the American Academy of Pediatrics and the North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition has prepared this report based on a comprehensive, systematic review and rating of the medical literature. This report accompanies a clinical report based on the literature review and expert opinion.

The subcommittee examined the diagnostic and therapeutic value of a medical and psychological history, diagnostic tests, and pharmacologic and behavioral therapy. The presence of alarm symptoms or signs (such as weight loss, gastrointestinal bleeding, persistent fever, chronic severe diarrhea, and significant vomiting) is associated with a higher prevalence of organic disease. There was insufficient evidence to state that the nature of the abdominal pain or the presence of associated symptoms (such as anorexia, nausea, headache, and joint pain) can discriminate between functional and organic disorders. Although children with chronic abdominal pain and their parents are more often anxious or depressed, the presence of anxiety, depression, behavior problems, or recent negative life events does not distinguish between functional and organic abdominal pain. Most children who are brought to the primary care physician's office for chronic abdominal pain are unlikely to require diagnostic testing.

Pediatric studies of therapeutic interventions were examined and found to be limited or inconclusive. (3/05)

CIRCUMCISION POLICY STATEMENT

Task Force on Circumcision

ABSTRACT. Male circumcision is a common procedure, generally performed during the newborn period in the United States. In 2007, the American Academy of Pediatrics (AAP) formed a multidisciplinary task force of AAP members and other stakeholders to evaluate the recent evidence on male circumcision and update the Academy's 1999 recommendations in this area. Evaluation of current evidence indicates that the health benefits of newborn male circumcision outweigh the risks and that the procedure's benefits justify access to this procedure for families who choose it. Specific benefits identified included prevention of urinary tract infections, penile cancer, and transmission of some sexually transmitted infections, including HIV. The American College of Obstetricians and Gynecologists has endorsed this statement. (8/12)

CLASSIFYING RECOMMENDATIONS FOR CLINICAL PRACTICE GUIDELINES

Steering Committee on Quality Improvement and Management

ABSTRACT. Clinical practice guidelines are intended to improve the quality of clinical care by reducing inappropriate variations, producing optimal outcomes for patients, minimizing harm, and promoting cost-effective practices. This statement proposes an explicit classification of recommendations for clinical practice guidelines of the American Academy of Pediatrics (AAP) to promote communication among guideline developers, implementers, and other users of guideline knowledge, to improve consistency, and to facilitate user understanding. The statement describes 3 sequential activities in developing evidence-based clinical practice guidelines and related policies: 1) determination of the aggregate evidence quality in support of a proposed recommendation; 2) evaluation of the anticipated balance between benefits and harms when the recommendation is carried out; and 3) designation of recommendation strength. An individual policy can be reported as a "strong recommendation," "recommendation," "option," or "no recommendation." Use of this classification is intended to improve consistency and increase the transparency of the guideline-development process, facilitate understanding of AAP clinical practice guidelines, and enhance both the utility and credibility of AAP clinical practice guidelines. (9/04)

CLIMATIC HEAT STRESS AND EXERCISING CHILDREN AND ADOLESCENTS

Council on Sports Medicine and Fitness and Council on School Health

ABSTRACT. Results of new research indicate that, contrary to previous thinking, youth do not have less effective thermoregulatory ability, insufficient cardiovascular capacity, or lower physical exertion tolerance compared with adults during exercise in the heat when adequate hydration is maintained. Accordingly, besides poor hydration status, the primary determinants of reduced performance and exertional heat-illness risk in youth during sports and

other physical activities in a hot environment include undue physical exertion, insufficient recovery between repeated exercise bouts or closely scheduled same-day training sessions or rounds of sports competition, and inappropriately wearing clothing, uniforms, and protective equipment that play a role in excessive heat retention. Because these known contributing risk factors are modifiable, exertional heat illness is usually preventable. With appropriate preparation, modifications, and monitoring, most healthy children and adolescents can safely participate in outdoor sports and other physical activities through a wide range of challenging warm to hot climatic conditions. (8/11)

CLINICAL GENETIC EVALUATION OF THE CHILD WITH MENTAL RETARDATION OR DEVELOPMENTAL DELAYS (CLINICAL REPORT)

John B. Moeschler, MD; Michael Shevell, MD; and Committee on Genetics

ABSTRACT. This clinical report describes the clinical genetic evaluation of the child with developmental delays or mental retardation. The purpose of this report is to describe the optimal clinical genetics diagnostic evaluation to assist pediatricians in providing a medical home for children with developmental delays or mental retardation and their families. The literature supports the benefit of expert clinical judgment by a consulting clinical geneticist in the diagnostic evaluation. However, it is recognized that local factors may preclude this particular option. No single approach to the diagnostic process is supported by the literature. This report addresses the diagnostic importance of clinical history, 3-generation family history, dysmorphicologic examination, neurologic examination, chromosome analysis (≥ 650 bands), fragile X molecular genetic testing, fluorescence in situ hybridization studies for subtelomere chromosome rearrangements, molecular genetic testing for typical and atypical presentations of known syndromes, computed tomography and/or magnetic resonance brain imaging, and targeted studies for metabolic disorders. (6/06, reaffirmed 5/12)

CLOSTRIDIUM DIFFICILE INFECTION IN INFANTS AND CHILDREN

Committee on Infectious Diseases

ABSTRACT. Infections caused by *Clostridium difficile* in hospitalized children are increasing. The recent publication of clinical practice guidelines for *C. difficile* infection in adults did not address issues that are specific to children. The purpose of this policy statement is to provide the pediatrician with updated information and recommendations about *C. difficile* infections affecting pediatric patients. (12/12)

COCHLEAR IMPLANTS IN CHILDREN: SURGICAL SITE INFECTIONS AND PREVENTION AND TREATMENT OF ACUTE OTITIS MEDIA AND MENINGITIS

Lorry G. Rubin, MD; Blake Papsin, MD; Committee on Infectious Diseases; and Section on Otolaryngology–Head and Neck Surgery

ABSTRACT. The use of cochlear implants is increasingly common, particularly in children younger than 3 years. Bacterial meningitis, often with associated acute otitis media, is more common in children with cochlear

implants than in groups of control children. Children with profound deafness who are candidates for cochlear implants should receive all age-appropriate doses of pneumococcal conjugate and *Haemophilus influenzae* type b conjugate vaccines and appropriate annual immunization against influenza. In addition, starting at 24 months of age, a single dose of 23-valent pneumococcal polysaccharide vaccine should be administered. Before implant surgery, primary care providers and cochlear implant teams should ensure that immunizations are up-to-date, preferably with completion of indicated vaccines at least 2 weeks before implant surgery. Imaging of the temporal bone/inner ear should be performed before cochlear implantation in all children with congenital deafness and all patients with profound hearing impairment and a history of bacterial meningitis to identify those with inner-ear malformations/cerebrospinal fluid fistulas or ossification of the cochlea. During the initial months after cochlear implantation, the risk of complications of acute otitis media may be higher than during subsequent time periods. Therefore, it is recommended that acute otitis media diagnosed during the first 2 months after implantation be initially treated with a parenteral antibiotic (eg, ceftriaxone or cefotaxime). Episodes occurring 2 months or longer after implantation can be treated with a trial of an oral antimicrobial agent (eg, amoxicillin or amoxicillin/clavulanate at a dose of approximately 90 mg/kg per day of amoxicillin component), provided the child does not appear toxic and the implant does not have a spacer/positioner, a wedge that rests in the cochlea next to the electrodes present in certain implant models available between 1999 and 2002. "Watchful waiting" without antimicrobial therapy is inappropriate for children with implants with acute otitis media. If feasible, tympanocentesis should be performed for acute otitis media, and the material should be sent for culture, but performance of this procedure should not result in an undue delay in initiating antimicrobial therapy. For patients with suspected meningitis, cerebrospinal fluid as well as middle-ear fluid, if present, should be sent for culture. Empiric antimicrobial therapy for meningitis occurring within 2 months of implantation should include an agent with broad activity against Gram-negative bacilli (eg, meropenem) plus vancomycin. For meningitis occurring 2 months or longer after implantation, standard empiric antimicrobial therapy for meningitis (eg, ceftriaxone plus vancomycin) is indicated. For patients with meningitis, urgent evaluation by an otolaryngologist is indicated for consideration of imaging and surgical exploration. (7/10)

COLLABORATIVE ROLE OF THE PEDIATRICIAN IN THE DIAGNOSIS AND MANAGEMENT OF BIPOLAR DISORDER IN ADOLESCENTS (CLINICAL REPORT)

Benjamin N. Shain, MD, PhD, and Committee on Adolescence

ABSTRACT. Despite the complexity of diagnosis and management, pediatricians have an important collaborative role in referring and partnering in the management of adolescents with bipolar disorder. This report presents the classification of bipolar disorder as well as interviewing and diagnostic guidelines. Treatment options are described, particularly focusing on medication management and rationale for the common practice of multiple,

simultaneous medications. Medication adverse effects may be problematic and better managed with collaboration between mental health professionals and pediatricians. Case examples illustrate a number of common diagnostic and management issues. (11/12)

COMMUNICATING WITH CHILDREN AND FAMILIES: FROM EVERYDAY INTERACTIONS TO SKILL IN CONVEYING DISTRESSING INFORMATION (TECHNICAL REPORT)

Marcia Levetown, MD, and Committee on Bioethics

ABSTRACT. Health care communication is a skill that is critical to safe and effective medical practice; it can and must be taught. Communication skill influences patient disclosure, treatment adherence and outcome, adaptation to illness, and bereavement. This article provides a review of the evidence regarding clinical communication in the pediatric setting, covering the spectrum from outpatient primary care consultation to death notification, and provides practical suggestions to improve communication with patients and families, enabling more effective, efficient, and empathic pediatric health care. (5/08, reaffirmed 5/11)

COMMUNITY PEDIATRICS: NAVIGATING THE INTERSECTION OF MEDICINE, PUBLIC HEALTH, AND SOCIAL DETERMINANTS OF CHILDREN'S HEALTH

Council on Community Pediatrics

ABSTRACT. This policy statement provides a framework for the pediatrician's role in promoting the health and well-being of all children in the context of their families and communities. It offers pediatricians a definition of community pediatrics, emphasizes the importance of recognizing social determinants of health, and delineates the need to partner with public health to address population-based child health issues. It also recognizes the importance of pediatric involvement in child advocacy at local, state, and federal levels to ensure all children have access to a high-quality medical home and to eliminate child health disparities. This statement provides a set of specific recommendations that underscore the critical nature of this dimension of pediatric practice, teaching, and research. (2/13)

COMPREHENSIVE EVALUATION OF THE CHILD WITH INTELLECTUAL DISABILITY OR GLOBAL DEVELOPMENTAL DELAYS (CLINICAL REPORT)

John B. Moeschler, MD, MS, FAAP, FACMG; Michael Shevell, MDCM, FRCP; and Committee on Genetics

ABSTRACT. Global developmental delay and intellectual disability are relatively common pediatric conditions. This report describes the recommended clinical genetics diagnostic approach. The report is based on a review of published reports, most consisting of medium to large case series of diagnostic tests used, and the proportion of those that led to a diagnosis in such patients. Chromosome microarray is designated as a first-line test and replaces the standard karyotype and fluorescent in situ hybridization subtelomere tests for the child with intellectual disability of unknown etiology. Fragile X testing remains an important first-line test. The importance of considering testing for inborn errors of metabolism in this population

is supported by a recent systematic review of the literature and several case series recently published. The role of brain MRI remains important in certain patients. There is also a discussion of the emerging literature on the use of whole-exome sequencing as a diagnostic test in this population. Finally, the importance of intentional comanagement among families, the medical home, and the clinical genetics specialty clinic is discussed. (8/14)

See full text on page 559.

COMPREHENSIVE HEALTH EVALUATION OF THE NEWLY ADOPTED CHILD (CLINICAL REPORT)

Veronnie F. Jones, MD, PhD, MSPH, and Committee on Early Childhood, Adoption, and Dependent Care

ABSTRACT. Children who join families through the process of adoption often have multiple health care needs. After placement in an adoptive home, it is essential that these children have a timely comprehensive health evaluation. This evaluation should include a review of all available medical records and a complete physical examination. Evaluation should also include diagnostic testing based on the findings from the history and physical examination as well as the risks presented by the child's previous living conditions. Age-appropriate screens should be performed, including, for example, newborn screening panels, hearing, vision, dental, and formal behavioral/developmental screens. The comprehensive assessment can occur at the time of the initial visit to the physician after adoptive placement or can take place over several visits. Adopted children should be referred to other medical specialists as deemed appropriate. The Section on Adoption and Foster Care is a resource within the American Academy of Pediatrics for physicians providing care for children who are being adopted. (12/11)

CONDOM USE BY ADOLESCENTS

Committee on Adolescence

ABSTRACT. Rates of sexual activity, pregnancies, and births among adolescents have continued to decline during the past decade to historic lows. Despite these positive trends, many adolescents remain at risk for unintended pregnancy and sexually transmitted infections (STIs). This policy statement has been developed to assist the pediatrician in understanding and supporting the use of condoms by their patients to prevent unintended pregnancies and STIs and address barriers to their use. When used consistently and correctly, male latex condoms reduce the risk of pregnancy and many STIs, including HIV. Since the last policy statement published 12 years ago, there is an increased evidence base supporting the protection provided by condoms against STIs. Rates of acquisition of STIs/HIV among adolescents remain unacceptably high. Interventions that increase availability or accessibility to condoms are most efficacious when combined with additional individual, small-group, or community-level activities that include messages about safer sex. Continued research is needed to inform public health interventions for adolescents that increase the consistent and correct use of condoms and promote dual protection of condoms for STI prevention with other effective methods of contraception. (10/13)

CONFLICTS BETWEEN RELIGIOUS OR SPIRITUAL BELIEFS AND PEDIATRIC CARE: INFORMED REFUSAL, EXEMPTIONS, AND PUBLIC FUNDING

Committee on Bioethics

ABSTRACT. Although respect for parents' decision-making authority is an important principle, pediatricians should report suspected cases of medical neglect, and the state should, at times, intervene to require medical treatment of children. Some parents' reasons for refusing medical treatment are based on their religious or spiritual beliefs. In cases in which treatment is likely to prevent death or serious disability or relieve severe pain, children's health and future autonomy should be protected. Because religious exemptions to child abuse and neglect laws do not equally protect all children and may harm some children by causing confusion about the duty to provide medical treatment, these exemptions should be repealed. Furthermore, public health care funds should not cover alternative unproven religious or spiritual healing practices. Such payments may inappropriately legitimize these practices as appropriate medical treatment. (10/13)

CONGENITAL ADRENAL HYPERPLASIA (TECHNICAL REPORT)

Section on Endocrinology and Committee on Genetics

ABSTRACT. The Section on Endocrinology and the Committee on Genetics of the American Academy of Pediatrics, in collaboration with experts from the field of pediatric endocrinology and genetics, developed this policy statement as a means of providing up-to-date information for the practicing pediatrician about current practice and controversial issues in congenital adrenal hyperplasia (CAH), including the current status of prenatal diagnosis and treatment, the benefits and problem areas of neonatal screening programs, and the management of children with nonclassic CAH. The reference list is designed to allow physicians who wish more information to research the topic more thoroughly. (12/00, reaffirmed 10/04)

A CONSENSUS STATEMENT ON HEALTH CARE TRANSITIONS FOR YOUNG ADULTS WITH SPECIAL HEALTH CARE NEEDS

American Academy of Pediatrics, American Academy of Family Physicians, and American College of Physicians-American Society of Internal Medicine

ABSTRACT. This policy statement represents a consensus on the critical first steps that the medical profession needs to take to realize the vision of a family-centered, continuous, comprehensive, coordinated, compassionate, and culturally competent health care system that is as developmentally appropriate as it is technically sophisticated. The goal of transition in health care for young adults with special health care needs is to maximize lifelong functioning and potential through the provision of high-quality, developmentally appropriate health care services that continue uninterrupted as the individual moves from adolescence to adulthood. This consensus document has now been approved as policy by the boards of the American Academy of Pediatrics, the American Academy of Family Physicians, and the American College of Physicians-American Society of Internal Medicine. (12/02)

CONSENT BY PROXY FOR NONURGENT PEDIATRIC CARE (CLINICAL REPORT)

Gary N. McAbee, DO, JD, and Committee on Medical Liability and Risk Management

ABSTRACT. Minor-aged patients are often brought to the pediatrician for nonurgent acute medical care, physical examinations, or health supervision visits by someone other than their legally authorized representative, which, in most situations, is a parent. These surrogates or proxies can be members of the child's extended family, such as a grandparent, adult sibling, or aunt/uncle; a noncustodial parent or stepparent in cases of divorce and remarriage; an adult who lives in the home but is not biologically or legally related to the child; or even a child care professional (eg, au pair, nanny). This report identifies common situations in which pediatricians may encounter "consent by proxy" for nonurgent medical care for minors, including physical examinations, and explains the potential for liability exposure associated with these circumstances. The report suggests practical steps that balance the need to minimize the physician's liability exposure with the patient's access to health care. Key issues to be considered when creating or updating office policies for obtaining and documenting consent by proxy are offered. (10/10)

CONSENT FOR EMERGENCY MEDICAL SERVICES FOR CHILDREN AND ADOLESCENTS

Committee on Pediatric Emergency Medicine and Committee on Bioethics

ABSTRACT. Parental consent generally is required for the medical evaluation and treatment of minor children. However, children and adolescents might require evaluation of and treatment for emergency medical conditions in situations in which a parent or legal guardian is not available to provide consent or conditions under which an adolescent patient might possess the legal authority to provide consent. In general, a medical screening examination and any medical care necessary and likely to prevent imminent and significant harm to the pediatric patient with an emergency medical condition should not be withheld or delayed because of problems obtaining consent. The purpose of this policy statement is to provide guidance in those situations in which parental consent is not readily available, in which parental consent is not necessary, or in which parental refusal of consent places a child at risk of significant harm. (7/11)

CONSUMPTION OF RAW OR UNPASTEURIZED MILK AND MILK PRODUCTS BY PREGNANT WOMEN AND CHILDREN

Committee on Infectious Diseases and Committee on Nutrition

ABSTRACT. Sales of raw or unpasteurized milk and milk products are still legal in at least 30 states in the United States. Raw milk and milk products from cows, goats, and sheep continue to be a source of bacterial infections attributable to a number of virulent pathogens, including *Listeria monocytogenes*, *Campylobacter jejuni*, *Salmonella* species, *Brucella* species, and *Escherichia coli* O157. These infections can occur in both healthy and immunocompromised individuals, including older adults, infants, young children, and pregnant women and their unborn fetuses, in

whom life-threatening infections and fetal miscarriage can occur. Efforts to limit the sale of raw milk products have met with opposition from those who are proponents of the purported health benefits of consuming raw milk products, which contain natural or unprocessed factors not inactivated by pasteurization. However, the benefits of these natural factors have not been clearly demonstrated in evidence-based studies and, therefore, do not outweigh the risks of raw milk consumption. Substantial data suggest that pasteurized milk confers equivalent health benefits compared with raw milk, without the additional risk of bacterial infections. The purpose of this policy statement was to review the risks of raw milk consumption in the United States and to provide evidence of the risks of infectious complications associated with consumption of unpasteurized milk and milk products, especially among pregnant women, infants, and children. (12/13)

CONTRACEPTION FOR ADOLESCENTS

Committee on Adolescence

ABSTRACT. Contraception is a pillar in reducing adolescent pregnancy rates. The American Academy of Pediatrics recommends that pediatricians develop a working knowledge of contraception to help adolescents reduce risks of and negative health consequences related to unintended pregnancy. Over the past 10 years, a number of new contraceptive methods have become available to adolescents, newer guidance has been issued on existing contraceptive methods, and the evidence base for contraception for special populations (adolescents who have disabilities, are obese, are recipients of solid organ transplants, or are HIV infected) has expanded. The Academy has addressed contraception since 1980, and this policy statement updates the 2007 statement on contraception and adolescents. It provides the pediatrician with a description and rationale for best practices in counseling and prescribing contraception for adolescents. It is supported by an accompanying technical report. (9/14)

See full text on page 577.

CONTRACEPTION FOR ADOLESCENTS (TECHNICAL REPORT)

Mary A. Ott, MD, MA, FAAP; Gina S. Sucato, MD, MPH, FAAP; and Committee on Adolescence

ABSTRACT. A working knowledge of contraception will assist the pediatrician in both sexual health promotion as well as treatment of common adolescent gynecologic problems. Best practices in adolescent anticipatory guidance and screening include a sexual health history, screening for pregnancy and sexually transmitted infections, counseling, and if indicated, providing access to contraceptives. Pediatricians' long-term relationships with adolescents and families allow them to help promote healthy sexual decision-making, including abstinence and contraceptive use. Additionally, medical indications for contraception, such as acne, dysmenorrhea, and heavy menstrual bleeding, are frequently uncovered during adolescent visits. This technical report provides an evidence base for the accompanying policy statement and addresses key aspects of adolescent contraceptive use, including the following: (1) sexual history taking, confidentiality, and counseling; (2) adolescent data on the use and side effects

of newer contraceptive methods; (3) new data on older contraceptive methods; and (4) evidence supporting the use of contraceptives in adolescent patients with complex medical conditions. (9/14)

See full text on page 593.

CONTROVERSIES CONCERNING VITAMIN K AND THE NEWBORN

Committee on Fetus and Newborn

ABSTRACT. Prevention of early vitamin K deficiency bleeding (VKDB) of the newborn, with onset at birth to 2 weeks of age (formerly known as classic hemorrhagic disease of the newborn), by oral or parenteral administration of vitamin K is accepted practice. In contrast, late VKDB, with onset from 2 to 12 weeks of age, is most effectively prevented by parenteral administration of vitamin K. Earlier concern regarding a possible causal association between parenteral vitamin K and childhood cancer has not been substantiated. This revised statement presents updated recommendations for the use of vitamin K in the prevention of early and late VKDB. (7/03, reaffirmed 5/06, 5/09)

COPARENT OR SECOND-PARENT ADOPTION BY SAME-SEX PARENTS

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. Children who are born to or adopted by 1 member of a same-sex couple deserve the security of 2 legally recognized parents. Therefore, the American Academy of Pediatrics supports legislative and legal efforts to provide the possibility of adoption of the child by the second parent or coparent in these families. (2/02, reaffirmed 5/09)

COPARENT OR SECOND-PARENT ADOPTION BY SAME-SEX PARENTS (TECHNICAL REPORT)

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. A growing body of scientific literature demonstrates that children who grow up with 1 or 2 gay and/or lesbian parents fare as well in emotional, cognitive, social, and sexual functioning as do children whose parents are heterosexual. Children's optimal development seems to be influenced more by the nature of the relationships and interactions within the family unit than by the particular structural form it takes. (2/02, reaffirmed 5/09)

CORPORAL PUNISHMENT IN SCHOOLS

Committee on School Health

ABSTRACT. The American Academy of Pediatrics recommends that corporal punishment in schools be abolished in all states by law and that alternative forms of student behavior management be used. (8/00, reaffirmed 6/03, 5/06, 2/12)

COUNSELING FAMILIES WHO CHOOSE COMPLEMENTARY AND ALTERNATIVE MEDICINE FOR THEIR CHILD WITH CHRONIC ILLNESS OR DISABILITY

Committee on Children With Disabilities

ABSTRACT. The use of complementary and alternative medicine (CAM) to treat chronic illness or disability is increasing in the United States. This is especially evident among children with autism and related disorders. It may

be challenging to the practicing pediatrician to distinguish among accepted biomedical treatments, unproven therapies, and alternative therapies. Moreover, there are no published guidelines regarding the use of CAM in the care of children with chronic illness or disability. To best serve the interests of children, it is important to maintain a scientific perspective, to provide balanced advice about therapeutic options, to guard against bias, and to establish and maintain a trusting relationship with families. This statement provides information and guidance for pediatricians when counseling families about CAM. (3/01, reaffirmed 1/05, 5/10)

COUNSELING THE ADOLESCENT ABOUT PREGNANCY OPTIONS

Committee on Adolescence

ABSTRACT. When consulted by a pregnant adolescent, pediatricians should be able to make a timely diagnosis and to help the adolescent understand her options and act on her decision to continue or terminate her pregnancy. Pediatricians may not impose their values on the decision-making process and should be prepared to support the adolescent in her decision or refer her to a physician who can. (5/98, reaffirmed 1/01, 1/06)

CREATING HEALTHY CAMP EXPERIENCES

Council on School Health

ABSTRACT. The American Academy of Pediatrics has created recommendations for health appraisal and preparation of young people before participation in day or resident camps and to guide health and safety practices for children at camp. These recommendations are intended for parents, primary health care providers, and camp administration and health center staff. Although camps have diverse environments, there are general guidelines that apply to all situations and specific recommendations that are appropriate under special conditions. This policy statement has been reviewed and is supported by the American Camp Association. (3/11)

THE CRUCIAL ROLE OF RECESS IN SCHOOL

Council on School Health

ABSTRACT. Recess is at the heart of a vigorous debate over the role of schools in promoting the optimal development of the whole child. A growing trend toward real-locating time in school to accentuate the more academic subjects has put this important facet of a child's school day at risk. Recess serves as a necessary break from the rigors of concentrated, academic challenges in the classroom. But equally important is the fact that safe and well-supervised recess offers cognitive, social, emotional, and physical benefits that may not be fully appreciated when a decision is made to diminish it. Recess is unique from, and a complement to, physical education—not a substitute for it. The American Academy of Pediatrics believes that recess is a crucial and necessary component of a child's development and, as such, it should not be withheld for punitive or academic reasons. (12/12)

DEALING WITH THE PARENT WHOSE JUDGMENT IS IMPAIRED BY ALCOHOL OR DRUGS: LEGAL AND ETHICAL CONSIDERATIONS (CLINICAL REPORT)

Committee on Medical Liability

ABSTRACT. An estimated 11 to 17.5 million children are being raised by a substance-abusing parent or guardian. The importance of this statistic is undeniable, particularly when a patient is brought to a pediatric office by a parent or guardian exhibiting symptoms of judgment impairment. Although the physician-patient relationship exists between the pediatrician and the minor patient, other obligations (some perceived and some real) should be considered as well. In managing encounters with impaired parents who may become disruptive or dangerous, pediatricians should be aware of their responsibilities before acting. In addition to fulfilling the duty involved with an established physician-patient relationship, the pediatrician should take reasonable care to safeguard patient confidentiality; protect the safety of the patient and other patients, visitors, and employees; and comply with reporting mandates. This clinical report identifies and discusses the legal and ethical concepts related to these circumstances. The report offers implementation suggestions when establishing anticipatory office procedures and training programs for staff on what to do (and not do) in such situations to maximize the patient's well-being and safety and minimize the liability of the pediatrician. (9/04, reaffirmed 9/10)

DEATH OF A CHILD IN THE EMERGENCY DEPARTMENT

Committee on Pediatric Emergency Medicine (joint with American College of Emergency Physicians Pediatric Emergency Medicine Committee and Emergency Nurses Association Pediatric Committee)

ABSTRACT. The American Academy of Pediatrics, American College of Emergency Physicians, and Emergency Nurses Association have collaborated to identify practices and principles to guide the care of children, families, and staff in the challenging and uncommon event of the death of a child in the emergency department in this policy statement and in an accompanying technical report. (6/14)

See full text on page 621.

DEATH OF A CHILD IN THE EMERGENCY DEPARTMENT (TECHNICAL REPORT)

Patricia O'Malley, MD; Isabel Barata, MD; Sally Snow, RN; and Committee on Pediatric Emergency Medicine (joint with American College of Emergency Physicians Pediatric Emergency Medicine Committee and Emergency Nurses Association Pediatric Committee)

ABSTRACT. The death of a child in the emergency department (ED) is one of the most challenging problems facing ED clinicians. This revised technical report and accompanying policy statement reaffirm principles of patient- and family-centered care. Recent literature is examined regarding family presence, termination of resuscitation, bereavement responsibilities of ED clinicians, support of child fatality review efforts, and other issues inherent in caring for the patient, family, and staff when a child dies in the ED. Appendices are provided that offer an approach to bereavement activities in the ED, carrying out forensic

responsibilities while providing compassionate care, communicating the news of the death of a child in the acute setting, providing a closing ritual at the time of terminating resuscitation efforts, and managing the child with a terminal condition who presents near death in the ED. (6/14)

DEVELOPMENTAL DYSPLASIA OF THE HIP PRACTICE GUIDELINE (TECHNICAL REPORT)

Harold P. Lehmann, MD, PhD; Richard Hinton, MD, MPH; Paola Morello, MD; Jeanne Santoli, MD; in conjunction with Steering Committee on Quality Improvement and Subcommittee on Developmental Dysplasia of the Hip

ABSTRACT. *Objective.* To create a recommendation for pediatricians and other primary care providers about their role as screeners for detecting developmental dysplasia of the hip (DDH) in children.

Patients. Theoretical cohorts of newborns.

Method. Model-based approach using decision analysis as the foundation. Components of the approach include the following:

Perspective: Primary care provider.

Outcomes: DDH, avascular necrosis of the hip (AVN).

Options: Newborn screening by pediatric examination; orthopaedic examination; ultrasonographic examination; orthopaedic or ultrasonographic examination by risk factors. Intercurrent health supervision-based screening.

Preferences: 0 for bad outcomes, 1 for best outcomes.

Model: Influence diagram assessed by the Subcommittee and by the methodology team, with critical feedback from the Subcommittee.

Evidence Sources: Medline and EMBASE search of the research literature through June 1996. Hand search of sentinel journals from June 1996 through March 1997. Ancestor search of accepted articles.

Evidence Quality: Assessed on a custom subjective scale, based primarily on the fit of the evidence to the decision model.

Results. After discussion, explicit modeling, and critique, an influence diagram of 31 nodes was created. The computer-based and the hand literature searches found 534 articles, 101 of which were reviewed by 2 or more readers. Ancestor searches of these yielded a further 17 articles for evidence abstraction. Articles came from around the globe, although primarily Europe, British Isles, Scandinavia, and their descendants. There were 5 controlled trials, each with a sample size less than 40. The remainder were case series. Evidence was available for 17 of the desired 30 probabilities. Evidence quality ranged primarily between one third and two thirds of the maximum attainable score (median: 10–21; interquartile range: 8–14). Based on the raw evidence and Bayesian hierarchical meta-analyses, our estimate for the incidence of DDH revealed by physical examination performed by pediatricians is 8.6 per 1000; for orthopaedic screening, 11.5; for ultrasonography, 25. The odds ratio for DDH, given breech delivery, is 5.5; for female sex, 4.1; for positive family history, 1.7, although this last factor is not statistically significant. Postneonatal cases of DDH were divided into mid-term (younger than 6 months of age) and late-

term (older than 6 months of age). Our estimates for the mid-term rate for screening by pediatricians is 0.34/1000 children screened; for orthopaedists, 0.1; and for ultrasonography, 0.28. Our estimates for late-term DDH rates are 0.21/1000 newborns screened by pediatricians; 0.08, by orthopaedists; and 0.2 for ultrasonography. The rates of AVN for children referred before 6 months of age is estimated at 2.5/1000 infants referred. For those referred after 6 months of age, our estimate is 109/1000 referred infants. The decision model (reduced, based on available evidence) suggests that orthopaedic screening is optimal, but because orthopaedists in the published studies and in practice would differ, the supply of orthopaedists is relatively limited, and the difference between orthopaedists and pediatricians is statistically insignificant, we conclude that pediatric screening is to be recommended. The place of ultrasonography in the screening process remains to be defined because there are too few data about postneonatal diagnosis by ultrasonographic screening to permit definitive recommendations. These data could be used by others to refine the conclusions based on costs, parental preferences, or physician style. Areas for research are well defined by our model-based approach. (4/00)

DIAGNOSIS AND MANAGEMENT OF AN INITIAL UTI IN FEBRILE INFANTS AND YOUNG CHILDREN (TECHNICAL REPORT)

S. Maria E. Finnell, MD, MS; Aaron E. Carroll, MD, MS; Stephen M. Downs, MD, MS; Steering Committee on Quality Improvement and Management; and Subcommittee on Urinary Tract Infection

ABSTRACT. *Objectives.* The diagnosis and management of urinary tract infections (UTIs) in young children are clinically challenging. This report was developed to inform the revised, evidence-based, clinical guideline regarding the diagnosis and management of initial UTIs in febrile infants and young children, 2 to 24 months of age, from the American Academy of Pediatrics Subcommittee on Urinary Tract Infection.

Methods. The conceptual model presented in the 1999 technical report was updated after a comprehensive review of published literature. Studies with potentially new information or with evidence that reinforced the 1999 technical report were retained. Meta-analyses on the effectiveness of antimicrobial prophylaxis to prevent recurrent UTI were performed.

Results. Review of recent literature revealed new evidence in the following areas. Certain clinical findings and new urinalysis methods can help clinicians identify febrile children at very low risk of UTI. Oral antimicrobial therapy is as effective as parenteral therapy in treating UTI. Data from published, randomized controlled trials do not support antimicrobial prophylaxis to prevent febrile UTI when vesicoureteral reflux is found through voiding cystourethrography. Ultrasonography of the urinary tract after the first UTI has poor sensitivity. Early antimicrobial treatment may decrease the risk of renal damage from UTI.

Conclusions. Recent literature agrees with most of the evidence presented in the 1999 technical report, but meta-analyses of data from recent, randomized controlled trials do not support antimicrobial prophylaxis to prevent febrile UTI. This finding argues against voiding cystourethrography after the first UTI. (8/11)

DIAGNOSIS AND MANAGEMENT OF CHILDHOOD OBSTRUCTIVE SLEEP APNEA SYNDROME (TECHNICAL REPORT)

Carole L. Marcus, MBBCh; Lee J. Brooks, MD; Sally Davidson Ward, MD; Kari A. Draper, MD; David Gozal, MD; Ann C. Halbower, MD; Jacqueline Jones, MD; Christopher Lehmann, MD; Michael S. Schechter, MD, MPH; Stephen Sheldon, MD; Richard N. Shiffman, MD, MCIS; Karen Spruyt, PhD; Steering Committee on Quality Improvement and Management; and Subcommittee on Obstructive Sleep Apnea Syndrome

ABSTRACT. *Objective.* This technical report describes the procedures involved in developing recommendations on the management of childhood obstructive sleep apnea syndrome (OSAS).

Methods. The literature from 1999 through 2011 was evaluated.

Results and Conclusions. A total of 3166 titles were reviewed, of which 350 provided relevant data. Most articles were level II through IV. The prevalence of OSAS ranged from 0% to 5.7%, with obesity being an independent risk factor. OSAS was associated with cardiovascular, growth, and neurobehavioral abnormalities and possibly inflammation. Most diagnostic screening tests had low sensitivity and specificity. Treatment of OSAS resulted in improvements in behavior and attention and likely improvement in cognitive abilities. Primary treatment is adenotonsillectomy (AT). Data were insufficient to recommend specific surgical techniques; however, children undergoing partial tonsillectomy should be monitored for possible recurrence of OSAS. Although OSAS improved postoperatively, the proportion of patients who had residual OSAS ranged from 13% to 29% in low-risk populations to 73% when obese children were included and stricter polysomnographic criteria were used. Nevertheless, OSAS may improve after AT even in obese children, thus supporting surgery as a reasonable initial treatment. A significant number of obese patients required intubation or continuous positive airway pressure (CPAP) postoperatively, which reinforces the need for inpatient observation. CPAP was effective in the treatment of OSAS, but adherence is a major barrier. For this reason, CPAP is not recommended as first-line therapy for OSAS when AT is an option. Intranasal steroids may ameliorate mild OSAS, but follow-up is needed. Data were insufficient to recommend rapid maxillary expansion. (8/12)

DIAGNOSIS AND PREVENTION OF IRON DEFICIENCY AND IRON-DEFICIENCY ANEMIA IN INFANTS AND YOUNG CHILDREN (0–3 YEARS OF AGE) (CLINICAL REPORT)

Robert D. Baker, MD, PhD; Frank R. Greer, MD; and Committee on Nutrition

ABSTRACT. This clinical report covers diagnosis and prevention of iron deficiency and iron-deficiency anemia

in infants (both breastfed and formula fed) and toddlers from birth through 3 years of age. Results of recent basic research support the concerns that iron-deficiency anemia and iron deficiency without anemia during infancy and childhood can have long-lasting detrimental effects on neurodevelopment. Therefore, pediatricians and other health care providers should strive to eliminate iron deficiency and iron-deficiency anemia. Appropriate iron intakes for infants and toddlers as well as methods for screening for iron deficiency and iron-deficiency anemia are presented. (10/10)

DIAGNOSIS OF HIV-1 INFECTION IN CHILDREN YOUNGER THAN 18 MONTHS IN THE UNITED STATES (TECHNICAL REPORT)

Jennifer S. Read, MD, MS, MPH, DTM&H, and Committee on Pediatric AIDS

ABSTRACT. The objectives of this technical report are to describe methods of diagnosis of HIV-1 infection in children younger than 18 months in the United States and to review important issues that must be considered by clinicians who care for infants and young children born to HIV-1-infected women. Appropriate HIV-1 diagnostic testing for infants and children younger than 18 months differs from that for older children, adolescents, and adults because of passively transferred maternal HIV-1 antibodies, which may be detectable in the child's bloodstream until 18 months of age. Therefore, routine serologic testing of these infants and young children is generally only informative before the age of 18 months if the test result is negative. Virologic assays, including HIV-1 DNA or RNA assays, represent the gold standard for diagnostic testing of infants and children younger than 18 months. With such testing, the diagnosis of HIV-1 infection (as well as the presumptive exclusion of HIV-1 infection) can be established within the first several weeks of life among nonbreastfed infants. Important factors that must be considered when selecting HIV-1 diagnostic assays for pediatric patients and when choosing the timing of such assays include the age of the child, potential timing of infection of the child, whether the infection status of the child's mother is known or unknown, the antiretroviral exposure history of the mother and of the child, and characteristics of the virus. If the mother's HIV-1 serostatus is unknown, rapid HIV-1 antibody testing of the newborn infant to identify HIV-1 exposure is essential so that antiretroviral prophylaxis can be initiated within the first 12 hours of life if test results are positive. For HIV-1-exposed infants (identified by positive maternal test results or positive antibody results for the infant shortly after birth), it has been recommended that diagnostic testing with HIV-1 DNA or RNA assays be performed within the first 14 days of life, at 1 to 2 months of age, and at 3 to 6 months of age. If any of these test results are positive, repeat testing is recommended to confirm the diagnosis of HIV-1 infection. A diagnosis of HIV-1 infection can be made on the basis of 2 positive HIV-1 DNA or RNA assay results. In nonbreastfeeding children younger than 18 months with no positive HIV-1 virologic test results, presumptive exclusion of HIV-1 infection can be based on 2 negative virologic test results (1 obtained at ≥ 2 weeks and 1 obtained at ≥ 4 weeks of age); 1 negative virologic test result obtained at ≥ 8 weeks

of age; or 1 negative HIV-1 antibody test result obtained at ≥ 6 months of age. Alternatively, presumptive exclusion of HIV-1 infection can be based on 1 positive HIV-1 virologic test with at least 2 subsequent negative virologic test results (at least 1 of which is performed at ≥ 8 weeks of age) or negative HIV-1 antibody test results (at least 1 of which is performed at ≥ 6 months of age). Definitive exclusion of HIV-1 infection is based on 2 negative virologic test results, 1 obtained at ≥ 1 month of age and 1 obtained at ≥ 4 months of age, or 2 negative HIV-1 antibody test results from separate specimens obtained at ≥ 6 months of age. For both presumptive and definitive exclusion of infection, the child should have no other laboratory (eg, no positive virologic test results) or clinical (eg, no AIDS-defining conditions) evidence of HIV-1 infection. Many clinicians confirm the absence of HIV-1 infection with a negative HIV-1 antibody assay result at 12 to 18 months of age. For breastfeeding infants, a similar testing algorithm can be followed, with timing of testing starting from the date of complete cessation of breastfeeding instead of the date of birth. (12/07, reaffirmed 4/10)

DIAGNOSTIC IMAGING OF CHILD ABUSE

Section on Radiology

ABSTRACT. The role of imaging in cases of child abuse is to identify the extent of physical injury when abuse is present and to elucidate all imaging findings that point to alternative diagnoses. Effective diagnostic imaging of child abuse rests on high-quality technology as well as a full appreciation of the clinical and pathologic alterations occurring in abused children. This statement is a revision of the previous policy published in 2000. (4/09)

DISASTER PLANNING FOR SCHOOLS

Council on School Health

ABSTRACT. Community awareness of the school district's disaster plan will optimize a community's capacity to maintain the safety of its school-aged population in the event of a school-based or greater community crisis. This statement is intended to stimulate awareness of the disaster-preparedness process in schools as a part of a global, community-wide preparedness plan. Pediatricians, other health care professionals, first responders, public health officials, the media, school nurses, school staff, and parents all need to be unified in their efforts to support schools in the prevention of, preparedness for, response to, and recovery from a disaster. (10/08, reaffirmed 9/11)

DISCLOSURE OF ILLNESS STATUS TO CHILDREN AND ADOLESCENTS WITH HIV INFECTION

Committee on Pediatric AIDS

ABSTRACT. Many children with human immunodeficiency virus (HIV) infection and acquired immunodeficiency syndrome are surviving to middle childhood and adolescence. Studies suggest that children who know their HIV status have higher self-esteem than children who are unaware of their status. Parents who have disclosed the status to their children experience less depression than those who do not. This statement addresses our current knowledge and recommendations for disclosure of HIV infection status to children and adolescents. (1/99, reaffirmed 2/02, 5/05, 1/09, 1/12)

DISPENSING MEDICATIONS AT THE HOSPITAL UPON DISCHARGE FROM AN EMERGENCY DEPARTMENT (TECHNICAL REPORT)

Loren G. Yamamoto, MD, MPH, MBA; Shannon Manzi,

PharmD; and Committee on Pediatric Emergency Medicine
ABSTRACT. Although most health care services can and should be provided by their medical home, children will be referred or require visits to the emergency department (ED) for emergent clinical conditions or injuries. Continuation of medical care after discharge from an ED is dependent on parents or caregivers' understanding of and compliance with follow-up instructions and on adherence to medication recommendations. ED visits often occur at times when the majority of pharmacies are not open and caregivers are concerned with getting their ill or injured child directly home. Approximately one-third of patients fail to obtain priority medications from a pharmacy after discharge from an ED. The option of judiciously dispensing ED discharge medications from the ED's outpatient pharmacy within the facility is a major convenience that overcomes this obstacle, improving the likelihood of medication adherence. Emergency care encounters should be routinely followed up with primary care provider medical homes to ensure complete and comprehensive care. (1/12)

DISTINGUISHING SUDDEN INFANT DEATH SYNDROME FROM CHILD ABUSE FATALITIES (CLINICAL REPORT)

Kent P. Hymel, MD, and Committee on Child Abuse and

Neglect (joint with National Association of Medical Examiners)

ABSTRACT. Fatal child abuse has been mistaken for sudden infant death syndrome. When a healthy infant younger than 1 year dies suddenly and unexpectedly, the cause of death may be certified as sudden infant death syndrome. Sudden infant death syndrome is more common than infanticide. Parents of sudden infant death syndrome victims typically are anxious to provide unlimited information to professionals involved in death investigation or research. They also want and deserve to be approached in a nonaccusatory manner. This clinical report provides professionals with information and suggestions for procedures to help avoid stigmatizing families of sudden infant death syndrome victims while allowing accumulation of appropriate evidence in potential cases of infanticide. This clinical report addresses deficiencies and updates recommendations in the 2001 American Academy of Pediatrics policy statement of the same name. (7/06, reaffirmed 4/09, 3/13)

DO-NOT-RESUSCITATE ORDERS FOR PEDIATRIC PATIENTS WHO REQUIRE ANESTHESIA AND SURGERY (CLINICAL REPORT)

Section on Surgery, Section on Anesthesia and Pain Medicine, and Committee on Bioethics

ABSTRACT. This clinical report addresses the topic of preexisting do-not-resuscitate (DNR) orders for children undergoing anesthesia and surgery. Pertinent issues addressed include the rights of children, surrogate decision-making, the process of informed consent, and the roles of surgeons and anesthesiologists. The reevaluation process of DNR orders called "required reconsideration"

can be incorporated into the process of informed consent for surgery and anesthesia. Care should be taken to distinguish between goal-directed and procedure-directed approaches to DNR orders. By giving parents or other surrogates and clinicians the option of deciding from among full resuscitation, limitations based on procedures, or limitations based on goals, the child's needs are individualized and better served. (12/04, reaffirmed 1/09, 10/12)

DRINKING WATER FROM PRIVATE WELLS AND RISKS TO CHILDREN

Committee on Environmental Health and Committee on Infectious Diseases

ABSTRACT. Drinking water for approximately one sixth of US households is obtained from private wells. These wells can become contaminated by pollutant chemicals or pathogenic organisms and cause illness. Although the US Environmental Protection Agency and all states offer guidance for construction, maintenance, and testing of private wells, there is little regulation. With few exceptions, well owners are responsible for their own wells. Children may also drink well water at child care or when traveling. Illness resulting from children's ingestion of contaminated water can be severe. This policy statement provides recommendations for inspection, testing, and remediation for wells providing drinking water for children. (5/09, reaffirmed 1/13)

DRINKING WATER FROM PRIVATE WELLS AND RISKS TO CHILDREN (TECHNICAL REPORT)

Walter J. Rogan, MD; Michael T. Brady, MD; Committee on Environmental Health; and Committee on Infectious Diseases

ABSTRACT. Drinking water for approximately one sixth of US households is obtained from private wells. These wells can become contaminated by pollutant chemicals or pathogenic organisms, leading to significant illness. Although the US Environmental Protection Agency and all states offer guidance for construction, maintenance, and testing of private wells, there is little regulation, and with few exceptions, well owners are responsible for their own wells. Children may also drink well water at child care or when traveling. Illness resulting from children's ingestion of contaminated water can be severe. This report reviews relevant aspects of groundwater and wells; describes the common chemical and microbiologic contaminants; gives an algorithm with recommendations for inspection, testing, and remediation for wells providing drinking water for children; reviews the definitions and uses of various bottled waters; provides current estimates of costs for well testing; and provides federal, national, state, and, where appropriate, tribal contacts for more information. (5/09, reaffirmed 1/13)

EARLY CHILDHOOD ADVERSITY, TOXIC STRESS, AND THE ROLE OF THE PEDIATRICIAN: TRANSLATING DEVELOPMENTAL SCIENCE INTO LIFELONG HEALTH

Committee on Psychosocial Aspects of Child and Family Health; Committee on Early Childhood, Adoption, and Dependent Care; and Section on Developmental and Behavioral Pediatrics

ABSTRACT. Advances in a wide range of biological, behavioral, and social sciences are expanding our understanding of how early environmental influences (the ecology) and genetic predispositions (the biologic program) affect learning capacities, adaptive behaviors, lifelong physical and mental health, and adult productivity. A supporting technical report from the American Academy of Pediatrics (AAP) presents an integrated ecobiodevelopmental framework to assist in translating these dramatic advances in developmental science into improved health across the life span. Pediatricians are now armed with new information about the adverse effects of toxic stress on brain development, as well as a deeper understanding of the early life origins of many adult diseases. As trusted authorities in child health and development, pediatric providers must now complement the early identification of developmental concerns with a greater focus on those interventions and community investments that reduce external threats to healthy brain growth. To this end, AAP endorses a developing leadership role for the entire pediatric community—one that mobilizes the scientific expertise of both basic and clinical researchers, the family-centered care of the pediatric medical home, and the public influence of AAP and its state chapters—to catalyze fundamental change in early childhood policy and services. AAP is committed to leveraging science to inform the development of innovative strategies to reduce the precipitants of toxic stress in young children and to mitigate their negative effects on the course of development and health across the life span. (12/11)

EARLY CHILDHOOD CARIES IN INDIGENOUS COMMUNITIES

Committee on Native American Child Health (joint with Canadian Paediatric Society First Nations, Inuit, and Métis Committee)

ABSTRACT. The oral health of Indigenous children of Canada (First Nations, Inuit, and Métis) and the United States (American Indian, Alaska Native) is a major child health issue: there is a high prevalence of early childhood caries (ECC) and resulting adverse health effects in this community, as well as high rates and costs of restorative and surgical treatments under general anesthesia. ECC is an infectious disease that is influenced by multiple factors, including socioeconomic determinants, and requires a combination of approaches for improvement. This statement includes recommendations for preventive oral health and clinical care for young infants and pregnant women by primary health care providers, community-based health-promotion initiatives, oral health workforce and access issues, and advocacy for community water fluoridation and fluoride-varnish program access. Further community-based research on the epidemiology, prevention, management, and microbiology of ECC in Indigenous communities would be beneficial. (5/11)

EARLY INTERVENTION, IDEA PART C SERVICES, AND THE MEDICAL HOME: COLLABORATION FOR BEST PRACTICE AND BEST OUTCOMES (CLINICAL REPORT)

Richard C. Adams, MD; Carl Tapia, MD; and Council on Children With Disabilities

ABSTRACT. The medical home and the Individuals With Disabilities Education Act Part C Early Intervention Program share many common purposes for infants and children ages 0 to 3 years, not the least of which is a family-centered focus. Professionals in pediatric medical home practices see substantial numbers of infants and toddlers with developmental delays and/or complex chronic conditions. Economic, health, and family-focused data each underscore the critical role of timely referral for relationship-based, individualized, accessible early intervention services and the need for collaborative partnerships in care. The medical home process and Individuals With Disabilities Education Act Part C policy both support nurturing relationships and family-centered care; both offer clear value in terms of economic and health outcomes. Best practice models for early intervention services incorporate learning in the natural environment and coaching models. Proactive medical homes provide strategies for effective developmental surveillance, family-centered resources, and tools to support high-risk groups, and comanagement of infants with special health care needs, including the monitoring of services provided and outcomes achieved. (9/13)

ECHOCARDIOGRAPHY IN INFANTS AND CHILDREN

Section on Cardiology

ABSTRACT. It is the intent of this statement to inform pediatric providers on the appropriate use of echocardiography. Although on-site consultation may be impossible, methods should be established to ensure timely review of echocardiograms by a pediatric cardiologist. With advances in data transmission, echocardiography information can be exchanged, in some cases eliminating the need for a costly patient transfer. By cooperating through training, education, and referral, complete and cost-effective echocardiographic services can be provided to all children. (6/97, reaffirmed 3/03, 3/07)

EDUCATION OF CHILDREN WITH HUMAN IMMUNODEFICIENCY VIRUS INFECTION

Committee on Pediatric AIDS

ABSTRACT. Treatment for human immunodeficiency virus (HIV) infection has enabled more children and youths to attend school and participate in school activities. Children and youths with HIV infection should receive the same education as those with other chronic illnesses. They may require special services, including home instruction, to provide continuity of education. Confidentiality about HIV infection status should be maintained with parental consent required for disclosure. Youths also should assent or consent as is appropriate for disclosure of their diagnosis. (6/00, reaffirmed 3/03, 10/06, 4/10, 3/13)

EFFECTS OF EARLY NUTRITIONAL INTERVENTIONS ON THE DEVELOPMENT OF ATOPIC DISEASE IN INFANTS AND CHILDREN: THE ROLE OF MATERNAL DIETARY RESTRICTION, BREASTFEEDING, TIMING OF INTRODUCTION OF COMPLEMENTARY FOODS, AND HYDROLYZED FORMULAS (CLINICAL REPORT)

Frank R. Greer, MD; Scott H. Sicherer, MD; A. Wesley Burks, MD; Committee on Nutrition; and Section on Allergy and Immunology

ABSTRACT. This clinical report reviews the nutritional options during pregnancy, lactation, and the first year of life that may affect the development of atopic disease (atopic dermatitis, asthma, food allergy) in early life. It replaces an earlier policy statement from the American Academy of Pediatrics that addressed the use of hypoallergenic infant formulas and included provisional recommendations for dietary management for the prevention of atopic disease. The documented benefits of nutritional intervention that may prevent or delay the onset of atopic disease are largely limited to infants at high risk of developing allergy (ie, infants with at least 1 first-degree relative [parent or sibling] with allergic disease). Current evidence does not support a major role for maternal dietary restrictions during pregnancy or lactation. There is evidence that breastfeeding for at least 4 months, compared with feeding formula made with intact cow milk protein, prevents or delays the occurrence of atopic dermatitis, cow milk allergy, and wheezing in early childhood. In studies of infants at high risk of atopy and who are not exclusively breastfed for 4 to 6 months, there is modest evidence that the onset of atopic disease may be delayed or prevented by the use of hydrolyzed formulas compared with formula made with intact cow milk protein, particularly for atopic dermatitis. Comparative studies of the various hydrolyzed formulas also indicate that not all formulas have the same protective benefit. There is also little evidence that delaying the timing of the introduction of complementary foods beyond 4 to 6 months of age prevents the occurrence of atopic disease. At present, there are insufficient data to document a protective effect of any dietary intervention beyond 4 to 6 months of age for the development of atopic disease. (1/08)

ELECTRONIC PRESCRIBING SYSTEMS IN PEDIATRICS: THE RATIONALE AND FUNCTIONALITY REQUIREMENTS

Council on Clinical Information Technology

ABSTRACT. The use of electronic prescribing applications in pediatric practice, as recommended by the federal government and other national health care improvement organizations, should be encouraged. Legislation and policies that foster adoption of electronic prescribing systems by pediatricians should recognize both specific pediatric requirements and general economic incentives required to speed the adoption of these systems. Continued research into improving the effectiveness of these systems, recognizing the unique challenges of providing care to the pediatric population, should be promoted. (6/07)

ELECTRONIC PRESCRIBING SYSTEMS IN PEDIATRICS: THE RATIONALE AND FUNCTIONALITY REQUIREMENTS (TECHNICAL REPORT)

Robert S. Gerstle, MD; Christoph U. Lehmann, MD; and

Council on Clinical Information Technology

ABSTRACT. This technical report discusses electronic prescribing systems and their limitations and potential benefits, particularly to the pediatrician in the ambulatory setting. In the report we acknowledge the benefits of integrating these systems with electronic health records and practice-management systems and recommend that the adoption of electronic prescribing systems be done in the context of ultimately moving toward an electronic health record. This technical report supports the accompanying American Academy of Pediatrics policy-statement recommendations on the adoption of electronic prescribing systems by pediatricians. (6/07)

ELECTRONIC PRESCRIBING IN PEDIATRICS: TOWARD SAFER AND MORE EFFECTIVE MEDICATION MANAGEMENT

Council on Clinical Information Technology

ABSTRACT. This policy statement identifies the potential value of electronic prescribing (e-prescribing) systems in improving quality and reducing harm in pediatric health care. On the basis of limited but positive pediatric data and on the basis of federal statutes that provide incentives for the use of e-prescribing systems, the American Academy of Pediatrics recommends the adoption of e-prescribing systems with pediatric functionality. The American Academy of Pediatrics also recommends a set of functions that technology vendors should provide when e-prescribing systems are used in environments in which children receive care. (3/13)

ELECTRONIC PRESCRIBING IN PEDIATRICS: TOWARD SAFER AND MORE EFFECTIVE MEDICATION MANAGEMENT (TECHNICAL REPORT)

Kevin B. Johnson, MD, MS; Christoph U. Lehmann, MD; and

Council on Clinical Information Technology

ABSTRACT. This technical report discusses recent advances in electronic prescribing (e-prescribing) systems, including the evidence base supporting their limitations and potential benefits. Specifically, this report acknowledges that there are limited but positive pediatric data supporting the role of e-prescribing in mitigating medication errors, improving communication with dispensing pharmacists, and improving medication adherence. On the basis of these data and on the basis of federal statutes that provide incentives for the use of e-prescribing systems, the American Academy of Pediatrics recommends the adoption of e-prescribing systems with pediatric functionality. This report supports the accompanying policy statement from the American Academy of Pediatrics recommending the adoption of e-prescribing by pediatric health care providers. (3/13)

EMERGENCY CONTRACEPTION

Committee on Adolescence

ABSTRACT. Despite significant declines over the past 2 decades, the United States continues to have teen birth rates that are significantly higher than other industrialized

nations. Use of emergency contraception can reduce the risk of pregnancy if used up to 120 hours after unprotected intercourse or contraceptive failure and is most effective if used in the first 24 hours. Indications for the use of emergency contraception include sexual assault, unprotected intercourse, condom breakage or slippage, and missed or late doses of hormonal contraceptives, including the oral contraceptive pill, contraceptive patch, contraceptive ring (ie, improper placement or loss/expulsion), and injectable contraception. Adolescents younger than 17 years must obtain a prescription from a physician to access emergency contraception in most states. In all states, both males and females 17 years or older can obtain emergency contraception without a prescription. Adolescents are more likely to use emergency contraception if it has been prescribed in advance of need. The aim of this updated policy statement is to (1) educate pediatricians and other physicians on available emergency contraceptive methods; (2) provide current data on safety, efficacy, and use of emergency contraception in teenagers; and (3) encourage routine counseling and advance emergency-contraception prescription as 1 part of a public health strategy to reduce teen pregnancy. This policy focuses on pharmacologic methods of emergency contraception used within 120 hours of unprotected or underprotected coitus for the prevention of unintended pregnancy. Emergency contraceptive medications include products labeled and dedicated for use as emergency contraception by the US Food and Drug Administration (levonorgestrel and ulipristal) and the "off-label" use of combination oral contraceptives. (11/12)

EMERGENCY CONTRACEPTION: ADDENDUM

Committee on Adolescence

This is an addendum to the American Academy of Pediatrics Policy Statement "Emergency Contraception" (Pediatrics. 2012;130(6):1174–1182).

In April 2013, Judge Edward Korman of the US District Court of Eastern New York directed the Food and Drug Administration (FDA) to lift the ban on over-the-counter availability of levonorgestrel-based emergency contraceptives without a prescription and without point-of-sale or age restrictions. In June 2013, the Obama administration withdrew its appeal to the Korman ruling, and the FDA allowed the 1-pill formulation Plan B One-Step (Teva Women's Health Inc, Frazer, PA) to be made available on the shelf without age restriction in the United States. The FDA granted Plan B One-Step 3 years of exclusive rights to sell the product without an age restriction. One-pill generic versions will likely be allowed to be sold on the shelf next to Plan B One-Step, but these products will require age verification and will not be sold to those younger than 17 years without a prescription. The 2-pill formulations of levonorgestrel-based emergency contraceptives will remain behind the pharmacy counter and will also not be sold to those younger than 17 years without a prescription. (2/14)

See full text on page 647.

EMERGENCY INFORMATION FORMS AND EMERGENCY PREPAREDNESS FOR CHILDREN WITH SPECIAL HEALTH CARE NEEDS

Committee on Pediatric Emergency Medicine and Council on Clinical Information Technology (joint with American College of Emergency Physicians Pediatric Emergency Medicine Committee)

ABSTRACT. Children with chronic medical conditions rely on complex management plans for problems that cause them to be at increased risk for suboptimal outcomes in emergency situations. The emergency information form (EIF) is a medical summary that describes medical condition(s), medications, and special health care needs to inform health care providers of a child's special health conditions and needs so that optimal emergency medical care can be provided. This statement describes updates to EIFs, including computerization of the EIF, expanding the potential benefits of the EIF, quality-improvement programs using the EIF, the EIF as a central repository, and facilitating emergency preparedness in disaster management and drills by using the EIF. (3/10, reaffirmed 7/14)

ENDORSEMENT OF HEALTH AND HUMAN SERVICES RECOMMENDATION FOR PULSE OXIMETRY SCREENING FOR CRITICAL CONGENITAL HEART DISEASE

Section on Cardiology and Cardiac Surgery Executive Committee

ABSTRACT. Incorporation of pulse oximetry to the assessment of the newborn infant can enhance detection of critical congenital heart disease (CCHD). Recently, the Secretary of Health and Human Services (HHS) recommended that screening for CCHD be added to the uniform screening panel. The American Academy of Pediatrics (AAP) has been a strong advocate of early detection of CCHD and fully supports the decision of the Secretary of HHS.

The AAP has published strategies for the implementation of pulse oximetry screening, which addressed critical issues such as necessary equipment, personnel, and training, and also provided specific recommendations for assessment of saturation by using pulse oximetry as well as appropriate management of a positive screening result. The AAP is committed to the safe and effective implementation of pulse oximetry screening and is working with other advocacy groups and governmental agencies to promote pulse oximetry and to support widespread surveillance for CCHD.

Going forward, AAP chapters will partner with state health departments to implement the new screening strategy for CCHD and will work to ensure that there is an adequate system for referral for echocardiographic/pediatric cardiac evaluation after a positive screening result. It is imperative that AAP members engage their respective policy makers in adopting and funding the recommendations made by the Secretary of HHS. (12/11)

ENHANCING PEDIATRIC WORKFORCE DIVERSITY AND PROVIDING CULTURALLY EFFECTIVE PEDIATRIC CARE: IMPLICATIONS FOR PRACTICE, EDUCATION, AND POLICY MAKING

Committee on Pediatric Workforce

ABSTRACT. This policy statement serves to combine and update 2 previously independent but overlapping state-

ments from the American Academy of Pediatrics (AAP) on culturally effective health care (CEHC) and workforce diversity. The AAP has long recognized that with the ever-increasing diversity of the pediatric population in the United States, the health of all children depends on the ability of all pediatricians to practice culturally effective care. CEHC can be defined as the delivery of care within the context of appropriate physician knowledge, understanding, and appreciation of all cultural distinctions, leading to optimal health outcomes. The AAP believes that CEHC is a critical social value and that the knowledge and skills necessary for providing CEHC can be taught and acquired through focused curricula across the spectrum of lifelong learning.

This statement also addresses workforce diversity, health disparities, and affirmative action. The discussion of diversity is broadened to include not only race, ethnicity, and language but also cultural attributes such as gender, religious beliefs, sexual orientation, and disability, which may affect the quality of health care. The AAP believes that efforts must be supported through health policy and advocacy initiatives to promote the delivery of CEHC and to overcome educational, organizational, and other barriers to improving workforce diversity. (9/13)

EPIDEMIOLOGY AND DIAGNOSIS OF HEALTH CARE-ASSOCIATED INFECTIONS IN THE NICU (TECHNICAL REPORT)

Committee on Fetus and Newborn and Committee on Infectious Diseases

ABSTRACT. Health care-associated infections in the NICU are a major clinical problem resulting in increased morbidity and mortality, prolonged length of hospital stays, and increased medical costs. Neonates are at high risk for health care-associated infections because of impaired host defense mechanisms, limited amounts of protective endogenous flora on skin and mucosal surfaces at time of birth, reduced barrier function of neonatal skin, the use of invasive procedures and devices, and frequent exposure to broad-spectrum antibiotics. This statement will review the epidemiology and diagnosis of health care-associated infections in newborn infants. (3/12)

EQUIPMENT FOR GROUND AMBULANCES

American Academy of Pediatrics (joint with American College of Emergency Physicians, American College of Surgeons Committee on Trauma, Emergency Medical Services for Children, Emergency Nurses Association, National Association of EMS Physicians, and National Association of State EMS Officials)

On January 1, 2014, the American Academy of Pediatrics, American College of Emergency Physicians, American College of Surgeons Committee on Trauma, Emergency Medical Services for Children, Emergency Nurses Association, National Association of EMS Physicians, and National Association of State EMS Officials coauthored a joint policy statement, "Equipment for Ground Ambulances" (*Prehosp Emerg Care.* 2014;19[1]:92-97). The full text of the joint policy statement is available at: <http://informahealthcare.com/doi/full/10.3109/10903127.2013.851312>. Copyright © 2014 Informa Plc. (8/14)

ESSENTIAL CONTRACTUAL LANGUAGE FOR MEDICAL NECESSITY IN CHILDREN

Committee on Child Health Financing

ABSTRACT. The previous policy statement from the American Academy of Pediatrics, "Model Language for Medical Necessity in Children," was published in July 2005. Since that time, there have been new and emerging delivery and payment models. The relationship established between health care providers and health plans should promote arrangements that are beneficial to all who are affected by these contractual arrangements. Pediatricians play an important role in ensuring that the needs of children are addressed in these emerging systems. It is important to recognize that health care plans designed for adults may not meet the needs of children. Language in health care contracts should reflect the health care needs of children and families. Informed pediatricians can make a difference in the care of children and influence the role of primary care physicians in the new paradigms. This policy highlights many of the important elements pediatricians should assess as providers develop a role in emerging care models. (7/13)

ETHICAL AND POLICY ISSUES IN GENETIC TESTING AND SCREENING OF CHILDREN

Committee on Bioethics and Committee on Genetics (joint with American College of Medical Genetics and Genomics)

ABSTRACT. The genetic testing and genetic screening of children are commonplace. Decisions about whether to offer genetic testing and screening should be driven by the best interest of the child. The growing literature on the psychosocial and clinical effects of such testing and screening can help inform best practices. This policy statement represents recommendations developed collaboratively by the American Academy of Pediatrics and the American College of Medical Genetics and Genomics with respect to many of the scenarios in which genetic testing and screening can occur. (2/13)

ETHICAL CONSIDERATIONS IN RESEARCH WITH SOCIALLY IDENTIFIABLE POPULATIONS

Committee on Native American Child Health and Committee on Community Health Services

ABSTRACT. Community-based research raises ethical issues not normally encountered in research conducted in academic settings. In particular, conventional risk-benefits assessments frequently fail to recognize harms that can occur in socially identifiable populations as a result of research participation. Furthermore, many such communities require more stringent measures of beneficence that must be applied directly to the participating communities. In this statement, the American Academy of Pediatrics sets forth recommendations for minimizing harms that may result from community-based research by emphasizing community involvement in the research process. (1/04, reaffirmed 10/07, 1/13)

ETHICAL CONTROVERSIES IN ORGAN DONATION AFTER CIRCULATORY DEATH

Committee on Bioethics

ABSTRACT. The persistent mismatch between the supply of and need for transplantable organs has led to efforts to increase the supply, including controlled donation after

circulatory death (DCD). Controlled DCD involves organ recovery after the planned withdrawal of life-sustaining treatment and the declaration of death according to the cardiorespiratory criteria. Two central ethical issues in DCD are when organ recovery can begin and how to manage conflicts of interests. The "dead donor rule" should be maintained, and donors in cases of DCD should only be declared dead after the permanent cessation of circulatory function. Permanence is generally established by a 2- to 5-minute waiting period. Given ongoing controversy over whether the cessation must also be irreversible, physicians should not be required to participate in DCD. Because the preparation for organ recovery in DCD begins before the declaration of death, there are potential conflicts between the donor's and recipient's interests. These conflicts can be managed in a variety of ways, including informed consent and separating the various participants' roles. For example, informed consent should be sought for pre-mortem interventions to improve organ viability, and organ procurement organization personnel and members of the transplant team should not be involved in the discontinuation of life-sustaining treatment or the declaration of death. It is also important to emphasize that potential donors in cases of DCD should receive integrated interdisciplinary palliative care, including sedation and analgesia. (4/13)

ETHICAL ISSUES WITH GENETIC TESTING IN PEDIATRICS

Committee on Bioethics

ABSTRACT. Advances in genetic research promise great strides in the diagnosis and treatment of many childhood diseases. However, emerging genetic technology often enables testing and screening before the development of definitive treatment or preventive measures. In these circumstances, careful consideration must be given to testing and screening of children to ensure that use of this technology promotes the best interest of the child. This statement reviews considerations for the use of genetic technology for newborn screening, carrier testing, and testing for susceptibility to late-onset conditions. Recommendations are made promoting informed participation by parents for newborn screening and limited use of carrier testing and testing for late-onset conditions in the pediatric population. Additional research and education in this developing area of medicine are encouraged. (6/01, reaffirmed 1/05, 1/09)

ETHICS AND THE CARE OF CRITICALLY ILL INFANTS AND CHILDREN

Committee on Bioethics

ABSTRACT. The ability to provide life support to ill children who, not long ago, would have died despite medicine's best efforts challenges pediatricians and families to address profound moral questions. Our society has been divided about extending the life of some patients, especially newborns and older infants with severe disabilities. The American Academy of Pediatrics (AAP) supports individualized decision making about life-sustaining medical treatment for all children, regardless of age. These decisions should be jointly made by physicians and parents, unless good reasons require invoking estab-

lished child protective services to contravene parental authority. At this time, resource allocation (rationing) decisions about which children should receive intensive care resources should be made clear and explicit in public policy, rather than be made at the bedside. (7/96, reaffirmed 10/99, 6/03)

EVALUATING CHILDREN WITH FRACTURES FOR CHILD PHYSICAL ABUSE (CLINICAL REPORT)

Emalee G. Flaherty, MD; Jeannette M. Perez-Rossello, MD; Michael A. Levine, MD; William L. Hennrikus, MD; Committee on Child Abuse and Neglect; Section on Radiology; Section on Endocrinology; and Section on Orthopaedics (joint with Society for Pediatric Radiology)

Fractures are common injuries caused by child abuse. Although the consequences of failing to diagnose an abusive injury in a child can be grave, incorrectly diagnosing child abuse in a child whose fractures have another etiology can be distressing for a family. The aim of this report is to review recent advances in the understanding of fracture specificity, the mechanism of fractures, and other medical diseases that predispose to fractures in infants and children. This clinical report will aid physicians in developing an evidence-based differential diagnosis and performing the appropriate evaluation when assessing a child with fractures. (1/14)

See full text on page 655.

EVALUATING FOR SUSPECTED CHILD ABUSE: CONDITIONS THAT PREDISPOSE TO BLEEDING (TECHNICAL REPORT)

Shannon L. Carpenter, MD, MS; Thomas C. Abshire, MD; James D. Anderst, MD, MS; Section on Hematology/Oncology; and Committee on Child Abuse and Neglect

ABSTRACT. Child abuse might be suspected when children present with cutaneous bruising, intracranial hemorrhage, or other manifestations of bleeding. In these cases, it is necessary to consider medical conditions that predispose to easy bleeding/bruising. When evaluating for the possibility of bleeding disorders and other conditions that predispose to hemorrhage, the pediatrician must consider the child's presenting history, medical history, and physical examination findings before initiating a laboratory investigation. Many medical conditions can predispose to easy bleeding. Before ordering laboratory tests for a disease, it is useful to understand the biochemical basis and clinical presentation of the disorder, condition prevalence, and test characteristics. This technical report reviews the major medical conditions that predispose to bruising/bleeding and should be considered when evaluating for abusive injury. (3/13)

EVALUATING INFANTS AND YOUNG CHILDREN WITH MULTIPLE FRACTURES (CLINICAL REPORT)

Carole Jenny, MD, MBA, FAAP, for Committee on Child Abuse and Neglect

ABSTRACT. Infants and toddlers with multiple unexplained fractures are often victims of inflicted injury. However, several medical conditions can also cause multiple fractures in children in this age group. In this report, the differential diagnosis of multiple fractures is presented, and diagnostic testing available to the clinician is discussed. The hypothetical entity "temporary brittle-bone

disease" is examined also. Although frequently offered in court cases as a cause of multiple infant fractures, there is no evidence that this condition actually exists. (9/06)

EVALUATION AND MANAGEMENT OF THE INFANT EXPOSED TO HIV-1 IN THE UNITED STATES (CLINICAL REPORT)

Peter L. Havens, MD; Lynne M. Mofenson, MD; and Committee on Pediatric AIDS

ABSTRACT. The pediatrician plays a key role in the prevention of mother-to-child transmission of HIV-1 infection. For infants born to women with HIV-1 infection identified during pregnancy, the pediatrician ensures that antiretroviral prophylaxis is provided to the infant to decrease the risk of acquiring HIV-1 infection and promotes avoidance of postnatal HIV-1 transmission by advising HIV-1-infected women not to breastfeed. The pediatrician should perform HIV-1 antibody testing for infants born to women whose HIV-1 infection status was not determined during pregnancy or labor. For HIV-1-exposed infants, the pediatrician monitors the infant for early determination of HIV-1 infection status and for possible short- and long-term toxicity from antiretroviral exposures. Provision of chemoprophylaxis for *Pneumocystis jiroveci* pneumonia and support of families living with HIV-1 by providing counseling to parents or caregivers are also important components of care. (12/08)

EVALUATION FOR BLEEDING DISORDERS IN SUSPECTED CHILD ABUSE (CLINICAL REPORT)

James D. Anderst, MD, MS; Shannon L. Carpenter, MD, MS; Thomas C. Abshire, MD; Section on Hematology/Oncology; and Committee on Child Abuse and Neglect

ABSTRACT. Bruising or bleeding in a child can raise the concern for child abuse. Assessing whether the findings are the result of trauma and/or whether the child has a bleeding disorder is critical. Many bleeding disorders are rare, and not every child with bruising/bleeding concerning for abuse requires an evaluation for bleeding disorders. In some instances, however, bleeding disorders can present in a manner similar to child abuse. The history and clinical evaluation can be used to determine the necessity of an evaluation for a possible bleeding disorder, and prevalence and known clinical presentations of individual bleeding disorders can be used to guide the extent of the laboratory testing. This clinical report provides guidance to pediatricians and other clinicians regarding the evaluation for bleeding disorders when child abuse is suspected. (3/13)

THE EVALUATION OF CHILDREN IN THE PRIMARY CARE SETTING WHEN SEXUAL ABUSE IS SUSPECTED (CLINICAL REPORT)

Carole Jenny, MD, MBA; James E. Crawford-Jakubiak, MD; and Committee on Child Abuse and Neglect

ABSTRACT. This clinical report updates a 2005 report from the American Academy of Pediatrics on the evaluation of sexual abuse in children. The medical assessment of suspected child sexual abuse should include obtaining a history, performing a physical examination, and obtaining appropriate laboratory tests. The role of the physician includes determining the need to report suspected sexual abuse; assessing the physical, emotional, and behavioral

consequences of sexual abuse; providing information to parents about how to support their child; and coordinating with other professionals to provide comprehensive treatment and follow-up of children exposed to child sexual abuse. (7/13)

THE EVALUATION OF SEXUAL BEHAVIORS IN CHILDREN (CLINICAL REPORT)

Nancy D. Kellogg, MD, and Committee on Child Abuse and Neglect

ABSTRACT. Most children will engage in sexual behaviors at some time during childhood. These behaviors may be normal but can be confusing and concerning to parents or disruptive or intrusive to others. Knowledge of age-appropriate sexual behaviors that vary with situational and environmental factors can assist the clinician in differentiating normal sexual behaviors from sexual behavior problems. Most situations that involve sexual behaviors in young children do not require child protective services intervention; for behaviors that are age-appropriate and transient, the pediatrician may provide guidance in supervision and monitoring of the behavior. If the behavior is intrusive, hurtful, and/or age-inappropriate, a more comprehensive assessment is warranted. Some children with sexual behavior problems may reside or have resided in homes characterized by inconsistent parenting, violence, abuse, or neglect and may require more immediate intervention and referrals. (8/09, reaffirmed 3/13)

EVALUATION OF SUSPECTED CHILD PHYSICAL ABUSE (CLINICAL REPORT)

Nancy D. Kellogg, MD, and Committee on Child Abuse and Neglect

ABSTRACT. This report provides guidance in the clinical approach to the evaluation of suspected physical abuse in children. The medical assessment is outlined with respect to obtaining a history, physical examination, and appropriate ancillary testing. The role of the physician may encompass reporting suspected abuse; assessing the consistency of the explanation, the child's developmental capabilities, and the characteristics of the injury or injuries; and coordination with other professionals to provide immediate and long-term treatment and follow-up for victims. Accurate and timely diagnosis of children who are suspected victims of abuse can ensure appropriate evaluation, investigation, and outcomes for these children and their families. (6/07, reaffirmed 5/12)

EVIDENCE FOR THE DIAGNOSIS AND TREATMENT OF ACUTE UNCOMPLICATED SINUSITIS IN CHILDREN: A SYSTEMATIC REVIEW (TECHNICAL REPORT)

Michael J. Smith, MD, MSCE

In 2001, the American Academy of Pediatrics published clinical practice guidelines for the management of acute bacterial sinusitis (ABS) in children. The technical report accompanying those guidelines included 21 studies that assessed the diagnosis and management of ABS in children. This update to that report incorporates studies of pediatric ABS that have been performed since 2001. Overall, 17 randomized controlled trials of the treatment of sinusitis in children were identified and analyzed. Four randomized, double-blind, placebo-controlled trials of antimicrobial therapy have been published. The results

of these studies varied, likely due to differences in inclusion and exclusion criteria. Because of this heterogeneity, formal meta-analyses were not performed. However, qualitative analysis of these studies suggests that children with greater severity of illness at presentation are more likely to benefit from antimicrobial therapy. An additional 5 trials compared different antimicrobial therapies but did not include placebo groups. Six trials assessed a variety of ancillary treatments for ABS in children, and 3 focused on subacute sinusitis. Although the number of pediatric trials has increased since 2001, there are still limited data to guide the diagnosis and management of ABS in children. Diagnostic and treatment guidelines focusing on severity of illness at the time of presentation have the potential to identify those children most likely to benefit from antimicrobial therapy and at the same time minimize unnecessary use of antibiotics. (6/13)

AN EVIDENCE-BASED REVIEW OF IMPORTANT ISSUES CONCERNING NEONATAL HYPERBILIRUBINEMIA (TECHNICAL REPORT)

Stanley Ip, MD; Mei Chung, MPH; John Kulig, MD, MPH; Rebecca O'Brien, MD; Robert Sege, MD, PhD; Stephan Glick, MD; M. Jeffrey Maisels, MB, BCH; Joseph Lau, MD; Steering Committee on Quality and Improvement; and Subcommittee on Hyperbilirubinemia

ABSTRACT. This article is adapted from a published evidence report concerning neonatal hyperbilirubinemia with an added section on the risk of blood exchange transfusion (BET). Based on a summary of multiple case reports that spanned more than 30 years, we conclude that kernicterus, although infrequent, has at least 10% mortality and at least 70% long-term morbidity. It is evident that the preponderance of kernicterus cases occurred in infants with a bilirubin level higher than 20 mg/dL. Given the diversity of conclusions on the relationship between peak bilirubin levels and behavioral and neurodevelopmental outcomes, it is apparent that the use of a single total serum bilirubin level to predict long-term outcomes is inadequate and will lead to conflicting results. Evidence for efficacy of treatments for neonatal hyperbilirubinemia was limited. Overall, the 4 qualifying studies showed that phototherapy had an absolute risk-reduction rate of 10% to 17% for prevention of serum bilirubin levels higher than 20 mg/dL in healthy infants with jaundice. There is no evidence to suggest that phototherapy for neonatal hyperbilirubinemia has any long-term adverse neurodevelopmental effects. Transcutaneous measurements of bilirubin have a linear correlation to total serum bilirubin and may be useful as screening devices to detect clinically significant jaundice and decrease the need for serum bilirubin determinations. Based on our review of the risks associated with BETs from 15 studies consisting mainly of infants born before 1970, we conclude that the mortality within 6 hours of BET ranged from 3 per 1000 to 4 per 1000 exchanged infants who were term and without serious hemolytic diseases. Regardless of the definitions and rates of BET-associated morbidity and the various pre-exchange clinical states of the exchanged infants, in many cases the morbidity was minor (eg, postexchange anemia). Based on the results from the most recent study to report BET morbidity, the overall risk of permanent

sequelae in 25 sick infants who survived BET was from 5% to 10%. (7/04)

EXCESSIVE SLEEPINESS IN ADOLESCENTS AND YOUNG ADULTS: CAUSES, CONSEQUENCES, AND TREATMENT STRATEGIES (TECHNICAL REPORT)

Richard P. Millman, MD; Working Group on Sleepiness in

Adolescents/Young Adults; and Committee on Adolescence
ABSTRACT. Adolescents and young adults are often excessively sleepy. This excessive sleepiness can have a profound negative effect on school performance, cognitive function, and mood and has been associated with other serious consequences such as increased incidence of automobile crashes. In this article we review available scientific knowledge about normal sleep changes in adolescents (13–22 years of age), the factors associated with chronic insufficient sleep, the effect of insufficient sleep on a variety of systems and functions, and the primary sleep disorders or organic dysfunctions that, if untreated, can cause excessive daytime sleepiness in this population. (6/05)

EXPERT WITNESS PARTICIPATION IN CIVIL AND CRIMINAL PROCEEDINGS

Committee on Medical Liability and Risk Management

ABSTRACT. The interests of the public and both the medical and legal professions are best served when scientifically sound and unbiased expert witness testimony is readily available in civil and criminal proceedings. As members of the medical community, patient advocates, and private citizens, pediatricians have ethical and professional obligations to assist in the administration of justice. The American Academy of Pediatrics believes that the adoption of the recommendations outlined in this statement will improve the quality of medical expert witness testimony in legal proceedings and, thereby, increase the probability of achieving outcomes that are fair, honest, and equitable. Strategies for enforcing guidance and promoting oversight of expert witnesses are proposed. (6/09)

EXPOSURE TO NONTRADITIONAL PETS AT HOME AND TO ANIMALS IN PUBLIC SETTINGS: RISKS TO CHILDREN (CLINICAL REPORT)

Larry K. Pickering, MD; Nina Marano, DVM, MPH; Joseph A. Bocchini, MD; Frederick J. Angulo, DVM, PhD; and Committee on Infectious Diseases

ABSTRACT. Exposure to animals can provide many benefits during the growth and development of children. However, there are potential risks associated with animal exposures, including exposure to nontraditional pets in the home and animals in public settings. Educational materials, regulations, and guidelines have been developed to minimize these risks. Pediatricians, veterinarians, and other health care professionals can provide advice on selection of appropriate pets as well as prevention of disease transmission from nontraditional pets and when children contact animals in public settings. (10/08, reaffirmed 12/11)

EYE EXAMINATION IN INFANTS, CHILDREN, AND YOUNG ADULTS BY PEDIATRICIANS

Committee on Practice and Ambulatory Medicine and Section on Ophthalmology (joint with American Association of Certified Orthoptists, American Association for Pediatric Ophthalmology and Strabismus, and American Academy of Ophthalmology)

ABSTRACT. Early detection and prompt treatment of ocular disorders in children is important to avoid lifelong visual impairment. Examination of the eyes should be performed beginning in the newborn period and at all well-child visits. Newborns should be examined for ocular structural abnormalities, such as cataract, corneal opacity, and ptosis, which are known to result in visual problems. Vision assessment beginning at birth has been endorsed by the American Academy of Pediatrics, the American Association for Pediatric Ophthalmology and Strabismus, and the American Academy of Ophthalmology. All children who are found to have an ocular abnormality or who fail vision assessment should be referred to a pediatric ophthalmologist or an eye care specialist appropriately trained to treat pediatric patients. (4/03, reaffirmed 5/07)

THE EYE EXAMINATION IN THE EVALUATION OF CHILD ABUSE (CLINICAL REPORT)

Alex V. Levin, MD, MHSc; Cindy W. Christian, MD; Committee on Child Abuse and Neglect; and Section on Ophthalmology

ABSTRACT. Retinal hemorrhage is an important indicator of possible abusive head trauma, but it is also found in a number of other conditions. Distinguishing the type, number, and pattern of retinal hemorrhages may be helpful in establishing a differential diagnosis. Identification of ocular abnormalities requires a full retinal examination by an ophthalmologist using indirect ophthalmoscopy through a pupil that has been pharmacologically dilated. At autopsy, removal of the eyes and orbital tissues may also reveal abnormalities not discovered before death. In previously well young children who experience unexpected apparent life-threatening events with no obvious cause, children with head trauma that results in significant intracranial hemorrhage and brain injury, victims of abusive head trauma, and children with unexplained death, premortem clinical eye examination and postmortem examination of the eyes and orbits may be helpful in detecting abnormalities that can help establish the underlying etiology. (7/10)

FACILITIES AND EQUIPMENT FOR THE CARE OF PEDIATRIC PATIENTS IN A COMMUNITY HOSPITAL (CLINICAL REPORT)

Committee on Hospital Care

ABSTRACT. Many children who require hospitalization are admitted to community hospitals that are more accessible for families and their primary care physicians but vary substantially in their pediatric resources. The intent of this clinical report is to provide basic guidelines for furnishing and equipping a pediatric area in a community hospital. (5/03, reaffirmed 5/07, 8/13)

FAILURE TO THRIVE AS A MANIFESTATION OF CHILD NEGLECT (CLINICAL REPORT)

Robert W. Block, MD; Nancy F. Krebs, MD; Committee on

Child Abuse and Neglect; and Committee on Nutrition

ABSTRACT. Failure to thrive is a common problem in infancy and childhood. It is most often multifactorial in origin. Inadequate nutrition and disturbed social interactions contribute to poor weight gain, delayed development, and abnormal behavior. The syndrome develops in a significant number of children as a consequence of child neglect. This clinical report is intended to focus the pediatrician on the consideration, evaluation, and management of failure to thrive when child neglect may be present. Child protective services agencies should be notified when the evaluation leads to a suspicion of abuse or neglect. (11/05, reaffirmed 1/09)

FALLS FROM HEIGHTS: WINDOWS, ROOFS, AND BALCONIES

Committee on Injury and Poison Prevention

ABSTRACT. Falls of all kinds represent an important cause of child injury and death. In the United States, approximately 140 deaths from falls occur annually in children younger than 15 years. Three million children require emergency department care for fall-related injuries. This policy statement examines the epidemiology of falls from heights and recommends preventive strategies for pediatricians and other child health care professionals. Such strategies involve parent counseling, community programs, building code changes, legislation, and environmental modification, such as the installation of window guards and balcony railings. (5/01, reaffirmed 10/04, 5/07, 6/10)

FAMILIES AND ADOPTION: THE PEDIATRICIAN'S ROLE IN SUPPORTING COMMUNICATION (CLINICAL REPORT)

Committee on Early Childhood, Adoption, and Dependent Care

ABSTRACT. Each year, more children join families through adoption. Pediatricians have an important role in assisting adoptive families in the various challenges they may face with respect to adoption. The acceptance of the differences between families formed through birth and those formed through adoption is essential in promoting positive emotional growth within the family. It is important for pediatricians to be informed about adoption and to share this knowledge with adoptive families. Parents need ongoing advice with respect to adoption issues and need to be supported in their communication with their adopted children. (12/03)

FATHERS AND PEDIATRICIANS: ENHANCING MEN'S ROLES IN THE CARE AND DEVELOPMENT OF THEIR CHILDREN (CLINICAL REPORT)

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. Research substantiates that fathers' interactions with their children can exert a positive influence on their children's development. This report suggests ways pediatricians can enhance fathers' caregiving involvement by offering specific, culturally sensitive advice and how pediatricians might change their office practices to

support and increase fathers' active involvement in their children's care and development. (5/04, reaffirmed 8/13)

FEVER AND ANTIPYRETIC USE IN CHILDREN (CLINICAL REPORT)

Janice E. Sullivan, MD; Henry C. Farrar, MD; Section on Clinical Pharmacology and Therapeutics; and Committee on Drugs

ABSTRACT. Fever in a child is one of the most common clinical symptoms managed by pediatricians and other health care providers and a frequent cause of parental concern. Many parents administer antipyretics even when there is minimal or no fever, because they are concerned that the child must maintain a "normal" temperature. Fever, however, is not the primary illness but is a physiologic mechanism that has beneficial effects in fighting infection. There is no evidence that fever itself worsens the course of an illness or that it causes long-term neurologic complications. Thus, the primary goal of treating the febrile child should be to improve the child's overall comfort rather than focus on the normalization of body temperature. When counseling the parents or caregivers of a febrile child, the general well-being of the child, the importance of monitoring activity, observing for signs of serious illness, encouraging appropriate fluid intake, and the safe storage of antipyretics should be emphasized. Current evidence suggests that there is no substantial difference in the safety and effectiveness of acetaminophen and ibuprofen in the care of a generally healthy child with fever. There is evidence that combining these 2 products is more effective than the use of a single agent alone; however, there are concerns that combined treatment may be more complicated and contribute to the unsafe use of these drugs. Pediatricians should also promote patient safety by advocating for simplified formulations, dosing instructions, and dosing devices. (2/11)

FINANCING GRADUATE MEDICAL EDUCATION TO MEET THE NEEDS OF CHILDREN AND THE FUTURE PEDIATRICIAN WORKFORCE

Committee on Pediatric Workforce

ABSTRACT. This policy statement articulates the positions of the American Academy of Pediatrics on graduate medical education and the associated costs and funding mechanisms. It reaffirms the policy of the American Academy of Pediatrics that graduate medical education is a public good and is an essential part of maintaining a high-quality physician workforce. The American Academy of Pediatrics advocates for lifelong learning across the continuum of medical education. This policy statement focuses on the financing of one component of this continuum, namely residency education. The statement calls on federal and state governments to continue their support of residency education and advocates for stable means of funding such as the establishment of an all-payer graduate medical education trust fund. It further proposes a portable authorization system that would allocate graduate medical education funds for direct medical education costs to accredited residency programs on the basis of the selection of the program by qualified student or residents. This system allows the funding to follow the residents to their program. Recognizing the critical

workforce needs of many pediatric medical subspecialties, pediatric surgical specialties, and other pediatric specialty disciplines, this statement maintains that subspecialty fellowship training and general pediatrics research fellowship training should receive adequate support from the graduate medical education financing system, including funding from the National Institutes of Health and other federal agencies, as appropriate. Furthermore, residency education that is provided in freestanding children's hospitals should receive a level of support equivalent to that of other teaching hospitals. The financing of graduate medical education is an important and effective tool to ensure that the future pediatrician workforce can provide optimal health care for infants, children, adolescents, and young adults. (4/08, reaffirmed 1/12)

FINANCING OF PEDIATRIC HOME HEALTH CARE

Committee on Child Health Financing and Section on Home Care

ABSTRACT. In certain situations, home health care has been shown to be a cost-effective alternative to inpatient hospital care. National health expenditures reveal that pediatric home health costs totaled \$5.3 billion in 2000. Medicaid is the major payer for pediatric home health care (77%), followed by other public sources (22%). Private health insurance and families each paid less than 1% of pediatric home health expenses. The most important factors affecting access to home health care are the inadequate supply of clinicians and ancillary personnel, shortages of home health nurses with pediatric expertise, inadequate payment, and restrictive insurance and managed care policies. Many children must stay in the NICU, PICU, and other pediatric wards and intermediate care areas at a much higher cost because of inadequate pediatric home health care services. The main financing problem pertaining to Medicaid is low payment to home health agencies at rates that are insufficient to provide beneficiaries access to home health services. Although home care services may be a covered benefit under private health plans, most do not cover private-duty nursing (83%), home health aides (45%), or home physical, occupational, or speech therapy (33%) and/or impose visit or monetary limits or caps. To advocate for improvements in financing of pediatric home health care, the American Academy of Pediatrics has developed several recommendations for public policy makers, federal and state Medicaid offices, private insurers, managed care plans, Title V officials, and home health care professionals. These recommendations will improve licensing, payment, coverage, and research related to pediatric home health services. (8/06)

FIREARM-RELATED INJURIES AFFECTING THE PEDIATRIC POPULATION

*Council on Injury, Violence, and Poison Prevention
Executive Committee*

ABSTRACT. The absence of guns from children's homes and communities is the most reliable and effective measure to prevent firearm-related injuries in children and adolescents. Adolescent suicide risk is strongly associated with firearm availability. Safe gun storage (guns unloaded and locked, ammunition locked separately) reduces chil-

dren's risk of injury. Physician counseling of parents about firearm safety appears to be effective, but firearm safety education programs directed at children are ineffective. The American Academy of Pediatrics continues to support a number of specific measures to reduce the destructive effects of guns in the lives of children and adolescents, including the regulation of the manufacture, sale, purchase, ownership, and use of firearms; a ban on semiautomatic assault weapons; and the strongest possible regulations of handguns for civilian use. (10/12)

FIREWORKS-RELATED INJURIES TO CHILDREN

Committee on Injury and Poison Prevention

ABSTRACT. An estimated 8500 individuals, approximately 45% of them children younger than 15 years, were treated in US hospital emergency departments during 1999 for fireworks-related injuries. The hands (40%), eyes (20%), and head and face (20%) are the body areas most often involved. Approximately one third of eye injuries from fireworks result in permanent blindness. During 1999, 16 people died as a result of injuries associated with fireworks. Every type of legally available consumer (so-called "safe and sane") firework has been associated with serious injury or death. In 1997, 20 100 fires were caused by fireworks, resulting in \$22.7 million in direct property damage. Fireworks typically cause more fires in the United States on the Fourth of July than all other causes of fire combined on that day. Pediatricians should educate parents, children, community leaders, and others about the dangers of fireworks. Fireworks for individual private use should be banned. Children and their families should be encouraged to enjoy fireworks at public fireworks displays conducted by professionals rather than purchase fireworks for home or private use. (7/01, reaffirmed 1/05, 2/08, 10/11)

FLUORIDE USE IN CARIES PREVENTION IN THE PRIMARY CARE SETTING (CLINICAL REPORT)

Melinda B. Clark, MD, FAAP; Rebecca L. Slayton, DDS, PhD; and Section on Oral Health

ABSTRACT. Dental caries remains the most common chronic disease of childhood in the United States. Caries is a largely preventable condition, and fluoride has proven effectiveness in the prevention of caries. The goals of this clinical report are to clarify the use of available fluoride modalities for caries prevention in the primary care setting and to assist pediatricians in using fluoride to achieve maximum protection against dental caries while minimizing the likelihood of enamel fluorosis. (8/14)

See full text on page 671.

FOLIC ACID FOR THE PREVENTION OF NEURAL TUBE DEFECTS

Committee on Genetics

ABSTRACT. The American Academy of Pediatrics endorses the US Public Health Service (USPHS) recommendation that all women capable of becoming pregnant consume 400 µg of folic acid daily to prevent neural tube defects (NTDs). Studies have demonstrated that periconceptional folic acid supplementation can prevent 50% or more of NTDs such as spina bifida and anencephaly. For

women who have previously had an NTD-affected pregnancy, the Centers for Disease Control and Prevention (CDC) recommends increasing the intake of folic acid to 4000 µg per day beginning at least 1 month before conception and continuing through the first trimester. Implementation of these recommendations is essential for the primary prevention of these serious and disabling birth defects. Because fewer than 1 in 3 women consume the amount of folic acid recommended by the USPHS, the Academy notes that the prevention of NTDs depends on an urgent and effective campaign to close this prevention gap. (8/99, reaffirmed 11/02, 1/07, 5/12)

FOLLOW-UP MANAGEMENT OF CHILDREN WITH TYMPANOSTOMY TUBES

Section on Otolaryngology and Bronchoesophagology

ABSTRACT. The follow-up care of children in whom tympanostomy tubes have been placed is shared by the pediatrician and the otolaryngologist. Guidelines are provided for routine follow-up evaluation, perioperative hearing assessment, and the identification of specific conditions and complications that warrant urgent otolaryngologic consultation. These guidelines have been developed by a consensus of expert opinions. (2/02)

FORGOING LIFE-SUSTAINING MEDICAL TREATMENT IN ABUSED CHILDREN

Committee on Child Abuse and Neglect and Committee on Bioethics

ABSTRACT. A decision to forgo life-sustaining medical treatment (LSMT) for a critically ill child injured as the result of abuse should be made using the same criteria as those used for any critically ill child. The parent or guardian of an abused child may have a conflict of interest when a decision to forgo LSMT risks changing the legal charge faced by a parent, guardian, relative, or acquaintance from assault to manslaughter or homicide. If a physician suspects that a parent or guardian is not acting in a child's best interest, further review and consultation should be sought in hopes of resolving the conflict. A guardian ad litem who will represent the child's interests regarding LSMT should be appointed in all cases in which a parent or guardian may have a conflict of interest. (11/00, reaffirmed 6/03, 10/06, 4/09)

FORGOING MEDICALLY PROVIDED NUTRITION AND HYDRATION IN CHILDREN (CLINICAL REPORT)

Douglas S. Diekema, MD, MPH; Jeffrey R. Botkin, MD, MPH; and Committee on Bioethics

ABSTRACT. There is broad consensus that withholding or withdrawing medical interventions is morally permissible when requested by competent patients or, in the case of patients without decision-making capacity, when the interventions no longer confer a benefit to the patient or when the burdens associated with the interventions outweigh the benefits received. The withdrawal or withholding of measures such as attempted resuscitation, ventilators, and critical care medications is common in the terminal care of adults and children. In the case of adults, a consensus has emerged in law and ethics that the medical administration of fluid and nutrition is not funda-

mentally different from other medical interventions such as use of ventilators; therefore, it can be forgone or withdrawn when a competent adult or legally authorized surrogate requests withdrawal or when the intervention no longer provides a net benefit to the patient. In pediatrics, forgoing or withdrawing medically administered fluids and nutrition has been more controversial because of the inability of children to make autonomous decisions and the emotional power of feeding as a basic element of the care of children. This statement reviews the medical, ethical, and legal issues relevant to the withholding or withdrawing of medically provided fluids and nutrition in children. The American Academy of Pediatrics concludes that the withdrawal of medically administered fluids and nutrition for pediatric patients is ethically acceptable in limited circumstances. Ethics consultation is strongly recommended when particularly difficult or controversial decisions are being considered. (7/09, reaffirmed 1/14)

THE FUTURE OF PEDIATRICS: MENTAL HEALTH COMPETENCIES FOR PEDIATRIC PRIMARY CARE

Committee on Psychosocial Aspects of Child and Family Health and Task Force on Mental Health

ABSTRACT. Pediatric primary care clinicians have unique opportunities and a growing sense of responsibility to prevent and address mental health and substance abuse problems in the medical home. In this report, the American Academy of Pediatrics proposes competencies requisite for providing mental health and substance abuse services in pediatric primary care settings and recommends steps toward achieving them. Achievement of the competencies proposed in this statement is a goal, not a current expectation. It will require innovations in residency training and continuing medical education, as well as a commitment by the individual clinician to pursue, over time, educational strategies suited to his or her learning style and skill level. System enhancements, such as collaborative relationships with mental health specialists and changes in the financing of mental health care, must precede enhancements in clinical practice. For this reason, the proposed competencies begin with knowledge and skills for systems-based practice. The proposed competencies overlap those of mental health specialists in some areas; for example, they include the knowledge and skills to care for children with attention-deficit/hyperactivity disorder, anxiety, depression, and substance abuse and to recognize psychiatric and social emergencies. In other areas, the competencies reflect the uniqueness of the primary care clinician's role: building resilience in all children; promoting healthy lifestyles; preventing or mitigating mental health and substance abuse problems; identifying risk factors and emerging mental health problems in children and their families; and partnering with families, schools, agencies, and mental health specialists to plan assessment and care. Proposed interpersonal and communication skills reflect the primary care clinician's critical role in overcoming barriers (perceived and/or experienced by children and families) to seeking help for mental health and substance abuse concerns. (6/09, reaffirmed 8/13)

GASTROESOPHAGEAL REFLUX: MANAGEMENT GUIDANCE FOR THE PEDIATRICIAN (CLINICAL REPORT)

Jenifer R. Lightdale, MD, MPH; David A. Gremse, MD; and

Section on Gastroenterology, Hepatology, and Nutrition

ABSTRACT. Recent comprehensive guidelines developed by the North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition define the common entities of gastroesophageal reflux (GER) as the physiologic passage of gastric contents into the esophagus and gastroesophageal reflux disease (GERD) as reflux associated with troublesome symptoms or complications. The ability to distinguish between GER and GERD is increasingly important to implement best practices in the management of acid reflux in patients across all pediatric age groups, as children with GERD may benefit from further evaluation and treatment, whereas conservative recommendations are the only indicated therapy in those with uncomplicated physiologic reflux. This clinical report endorses the rigorously developed, well-referenced North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition guidelines and likewise emphasizes important concepts for the general pediatrician. A key issue is distinguishing between clinical manifestations of GER and GERD in term infants, children, and adolescents to identify patients who can be managed with conservative treatment by the pediatrician and to refer patients who require consultation with the gastroenterologist. Accordingly, the evidence basis presented by the guidelines for diagnostic approaches as well as treatments is discussed. Lifestyle changes are emphasized as first-line therapy in both GER and GERD, whereas medications are explicitly indicated only for patients with GERD. Surgical therapies are reserved for children with intractable symptoms or who are at risk for life-threatening complications of GERD. Recent black box warnings from the US Food and Drug Administration are discussed, and caution is underlined when using promoters of gastric emptying and motility. Finally, attention is paid to increasing evidence of inappropriate prescriptions for proton pump inhibitors in the pediatric population. (4/13)

GENERIC PRESCRIBING, GENERIC SUBSTITUTION, AND THERAPEUTIC SUBSTITUTION

Committee on Drugs (5/87, reaffirmed 6/93, 5/96, 6/99, 5/01, 5/05, 10/08, 10/12)

GLOBAL CLIMATE CHANGE AND CHILDREN'S HEALTH *Committee on Environmental Health*

ABSTRACT. There is broad scientific consensus that Earth's climate is warming rapidly and at an accelerating rate. Human activities, primarily the burning of fossil fuels, are very likely (>90% probability) to be the main cause of this warming. Climate-sensitive changes in ecosystems are already being observed, and fundamental, potentially irreversible, ecological changes may occur in the coming decades. Conservative environmental estimates of the impact of climate changes that are already in process indicate that they will result in numerous health effects to children. The nature and extent of these changes will be greatly affected by actions taken or not taken now at the global level.

Physicians have written on the projected effects of climate change on public health, but little has been written specifically on anticipated effects of climate change on children's health. Children represent a particularly vulnerable group that is likely to suffer disproportionately from both direct and indirect adverse health effects of climate change. Pediatric health care professionals should understand these threats, anticipate their effects on children's health, and participate as children's advocates for strong mitigation and adaptation strategies now. Any solutions that address climate change must be developed within the context of overall sustainability (the use of resources by the current generation to meet current needs while ensuring that future generations will be able to meet their needs). Pediatric health care professionals can be leaders in a move away from a traditional focus on disease prevention to a broad, integrated focus on sustainability as synonymous with health.

This policy statement is supported by a technical report that examines in some depth the nature of the problem of climate change, likely effects on children's health as a result of climate change, and the critical importance of responding promptly and aggressively to reduce activities that are contributing to this change. (11/07, reaffirmed 5/12)

GLOBAL CLIMATE CHANGE AND CHILDREN'S HEALTH (TECHNICAL REPORT)

Katherine M. Shea, MD, MPH, and Committee on

Environmental Health

ABSTRACT. There is a broad scientific consensus that the global climate is warming, the process is accelerating, and that human activities are very likely (>90% probability) the main cause. This warming will have effects on ecosystems and human health, many of them adverse. Children will experience both the direct and indirect effects of climate change. Actions taken by individuals, communities, businesses, and governments will affect the magnitude and rate of global climate change and resultant health impacts. This technical report reviews the nature of the global problem and anticipated health effects on children and supports the recommendations in the accompanying policy statement on climate change and children's health. (11/07, reaffirmed 5/12)

GRADUATE MEDICAL EDUCATION AND PEDIATRIC WORKFORCE ISSUES AND PRINCIPLES

Task Force on Graduate Medical Education Reform (6/94)

GUIDANCE FOR EFFECTIVE DISCIPLINE

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. When advising families about discipline strategies, pediatricians should use a comprehensive approach that includes consideration of the parent-child relationship, reinforcement of desired behaviors, and consequences for negative behaviors. Corporal punishment is of limited effectiveness and has potentially deleterious side effects. The American Academy of Pediatrics recommends that parents be encouraged and assisted in the development of methods other than spanking for managing undesired behavior. (4/98, reaffirmed 3/01, 1/05, 5/12, 4/14)

GUIDANCE FOR THE ADMINISTRATION OF MEDICATION IN SCHOOL

Council on School Health

ABSTRACT. Many children who take medications require them during the school day. This policy statement is designed to guide prescribing health care professionals, school physicians, and school health councils on the administration of medications to children at school. All districts and schools need to have policies and plans in place for safe, effective, and efficient administration of medications at school. Having full-time licensed registered nurses administering all routine and emergency medications in schools is the best situation. When a licensed registered nurse is not available, a licensed practical nurse may administer medications. When a nurse cannot administer medication in school, the American Academy of Pediatrics supports appropriate delegation of nursing services in the school setting. Delegation is a tool that may be used by the licensed registered school nurse to allow unlicensed assistive personnel to provide standardized, routine health services under the supervision of the nurse and on the basis of physician guidance and school nursing assessment of the unique needs of the individual child and the suitability of delegation of specific nursing tasks. Any delegation of nursing duties must be consistent with the requirements of state nurse practice acts, state regulations, and guidelines provided by professional nursing organizations. Long-term, emergency, and short-term medications; over-the-counter medications; alternative medications; and experimental drugs that are administered as part of a clinical trial are discussed in this statement. This statement has been endorsed by the American School Health Association. (9/09, reaffirmed 2/13)

GUIDANCE ON MANAGEMENT OF ASYMPTOMATIC NEONATES BORN TO WOMEN WITH ACTIVE GENITAL HERPES LESIONS (CLINICAL REPORT)

Committee on Infectious Diseases and Committee on Fetus and Newborn

ABSTRACT. Herpes simplex virus (HSV) infection of the neonate is uncommon, but genital herpes infections in adults are very common. Thus, although treating an infant with neonatal herpes is a relatively rare occurrence, managing infants potentially exposed to HSV at the time of delivery occurs more frequently. The risk of transmitting HSV to an infant during delivery is determined in part by the mother's previous immunity to HSV. Women with primary genital HSV infections who are shedding HSV at delivery are 10 to 30 times more likely to transmit the virus to their newborn infants than are women with recurrent HSV infection who are shedding virus at delivery. With the availability of commercial serological tests that reliably can distinguish type-specific HSV antibodies, it is now possible to determine the type of maternal infection and, thus, further refine management of infants delivered to women who have active genital HSV lesions. The management algorithm presented herein uses both serological and virological studies to determine the risk of HSV transmission to the neonate who is delivered to a mother with active herpetic genital lesions and tailors management accordingly. The algorithm does not address the

approach to asymptomatic neonates delivered to women with a history of genital herpes but no active lesions at delivery. (1/13)

GUIDELINES FOR CARE OF CHILDREN IN THE EMERGENCY DEPARTMENT

Committee on Pediatric Emergency Medicine (joint with American College of Emergency Physicians Pediatric Committee and Emergency Nurses Association Pediatric Committee)

ABSTRACT. Children who require emergency care have unique needs, especially when emergencies are serious or life-threatening. The majority of ill and injured children are brought to community hospital emergency departments (EDs) by virtue of their geography within communities. Similarly, emergency medical services (EMS) agencies provide the bulk of out-of-hospital emergency care to children. It is imperative, therefore, that all hospital EDs have the appropriate resources (medications, equipment, policies, and education) and staff to provide effective emergency care for children. This statement outlines resources necessary to ensure that hospital EDs stand ready to care for children of all ages, from neonates to adolescents. These guidelines are consistent with the recommendations of the Institute of Medicine's report on the future of emergency care in the United States health system. Although resources within emergency and trauma care systems vary locally, regionally, and nationally, it is essential that hospital ED staff and administrators and EMS systems' administrators and medical directors seek to meet or exceed these guidelines in efforts to optimize the emergency care of children they serve. This statement has been endorsed by the Academic Pediatric Association, American Academy of Family Physicians, American Academy of Physician Assistants, American College of Osteopathic Emergency Physicians, American College of Surgeons, American Heart Association, American Medical Association, American Pediatric Surgical Association, Brain Injury Association of America, Child Health Corporation of America, Children's National Medical Center, Family Voices, National Association of Children's Hospitals and Related Institutions, National Association of EMS Physicians, National Association of Emergency Medical Technicians, National Association of State EMS Officials, National Committee for Quality Assurance, National PTA, Safe Kids USA, Society of Trauma Nurses, Society for Academic Emergency Medicine, and The Joint Commission. (9/09, reaffirmed 4/13)

GUIDELINES FOR DEVELOPING ADMISSION AND DISCHARGE POLICIES FOR THE PEDIATRIC INTENSIVE CARE UNIT (CLINICAL REPORT)

Committee on Hospital Care and Section on Critical Care (joint with Society of Critical Care Medicine Pediatric Section Admission Criteria Task Force)

ABSTRACT. These guidelines were developed to provide a reference for preparing policies on admission to and discharge from pediatric intensive care units. They represent a consensus opinion of physicians, nurses, and allied health care professionals. By using this document as a framework for developing multidisciplinary admission and discharge policies, use of pediatric intensive care

units can be optimized and patients can receive the level of care appropriate for their condition. (4/99, reaffirmed 5/05, 2/08, 1/13)

GUIDELINES FOR HOME CARE OF INFANTS, CHILDREN, AND ADOLESCENTS WITH CHRONIC DISEASE

Committee on Children With Disabilities (7/95, reaffirmed 4/00, 1/06)

GUIDELINES FOR MONITORING AND MANAGEMENT OF PEDIATRIC PATIENTS DURING AND AFTER SEDATION FOR DIAGNOSTIC AND THERAPEUTIC PROCEDURES: AN UPDATE (CLINICAL REPORT)

Charles J. Coté, MD; Stephen Wilson, DMD, MA, PhD; and Work Group on Sedation (joint with American Academy of Pediatric Dentistry)

ABSTRACT. The safe sedation of children for procedures requires a systematic approach that includes the following: no administration of sedating medication without the safety net of medical supervision; careful presedation evaluation for underlying medical or surgical conditions that would place the child at increased risk from sedating medications; appropriate fasting for elective procedures and a balance between depth of sedation and risk for those who are unable to fast because of the urgent nature of the procedure; a focused airway examination for large tonsils or anatomic airway abnormalities that might increase the potential for airway obstruction; a clear understanding of the pharmacokinetic and pharmacodynamic effects of the medications used for sedation, as well as an appreciation for drug interactions; appropriate training and skills in airway management to allow rescue of the patient; age- and size-appropriate equipment for airway management and venous access; appropriate medications and reversal agents; sufficient numbers of people to carry out the procedure and monitor the patient; appropriate physiologic monitoring during and after the procedure; a properly equipped and staffed recovery area; recovery to presedation level of consciousness before discharge from medical supervision; and appropriate discharge instructions. This report was developed through a collaborative effort of the American Academy of Pediatrics and the American Academy of Pediatric Dentistry to offer pediatric providers updated information and guidance in delivering safe sedation to children. (12/06, reaffirmed 3/11)

GUIDELINES FOR PEDIATRIC CANCER CENTERS

Section on Hematology/Oncology

ABSTRACT. Since the American Academy of Pediatrics published guidelines for pediatric cancer centers in 1986 and 1997, significant changes in the delivery of health care have prompted a review of the role of tertiary medical centers in the care of pediatric patients. The potential effect of these changes on the treatment and survival rates of children with cancer led to this revision. The intent of this statement is to delineate personnel and facilities that are essential to provide state-of-the-art care for children and adolescents with cancer. This statement emphasizes the importance of board-certified pediatric hematologists/oncologists, pediatric subspecialty consultants, and appropriately qualified pediatric medical subspecialists and pediatric surgical specialists overseeing the care of all pediatric and adolescent cancer patients and the need

for facilities available only at a tertiary center as essential for the initial management and much of the follow-up for pediatric and adolescent cancer patients. (6/04, reaffirmed 10/08)

GUIDELINES FOR PEDIATRIC CARDIOVASCULAR CENTERS

Section on Cardiology and Cardiac Surgery

ABSTRACT. Pediatric cardiovascular centers should aim to provide high-quality therapeutic outcomes for infants and children with congenital and acquired heart diseases. This policy statement describes critical elements and organizational features of centers in which high-quality outcomes have the greatest likelihood of occurring. Center elements include noninvasive diagnostic modalities, cardiac catheterization, cardiovascular surgery, and cardiovascular intensive care. These elements should be organizationally united in centers in which pediatric cardiac physician specialists and specialized pediatric staff work together to achieve and surpass existing quality-of-care benchmarks. (3/02, reaffirmed 10/07)

GUIDELINES FOR THE DETERMINATION OF BRAIN DEATH IN INFANTS AND CHILDREN: AN UPDATE OF THE 1987 TASK FORCE RECOMMENDATIONS (CLINICAL REPORT)

Thomas A. Nakagawa, MD; Stephen Ashwal, MD;

Mudit Mathur, MD; Mohan Mysore, MD; Section on Critical Care; and Section on Neurology (joint with Society of Critical Care Medicine and Child Neurology Society)

ABSTRACT. Objective. To review and revise the 1987 pediatric brain death guidelines.

Methods. Relevant literature was reviewed. Recommendations were developed using the GRADE system.

Conclusions and Recommendations.

(1) Determination of brain death in term newborns, infants and children is a clinical diagnosis based on the absence of neurologic function with a known irreversible cause of coma. Because of insufficient data in the literature, recommendations for preterm infants less than 37 weeks gestational age are not included in this guideline.

(2) Hypotension, hypothermia, and metabolic disturbances should be treated and corrected and medications that can interfere with the neurologic examination and apnea testing should be discontinued allowing for adequate clearance before proceeding with these evaluations.

(3) Two examinations including apnea testing with each examination separated by an observation period are required. Examinations should be performed by different attending physicians. Apnea testing may be performed by the same physician. An observation period of 24 hours for term newborns (37 weeks gestational age) to 30 days of age, and 12 hours for infants and children (> 30 days to 18 years) is recommended. The first examination determines the child has met the accepted neurologic examination criteria for brain death. The second examination confirms brain death based on an unchanged and irreversible condition. Assessment of neurologic function following cardiopulmonary resuscitation or other severe acute brain injuries should be deferred for 24 hours or longer if there are concerns or inconsistencies in the examination.

(4) Apnea testing to support the diagnosis of brain death must be performed safely and requires documentation of an arterial PaCO₂ 20 mm Hg above the baseline and 60 mm Hg with no respiratory effort during the testing period. If the apnea test cannot be safely completed, an ancillary study should be performed.

(5) Ancillary studies (electroencephalogram and radio-nuclide cerebral blood flow) are not required to establish brain death and are not a substitute for the neurologic examination. Ancillary studies may be used to assist the clinician in making the diagnosis of brain death (i) when components of the examination or apnea testing cannot be completed safely due to the underlying medical condition of the patient; (ii) if there is uncertainty about the results of the neurologic examination; (iii) if a medication effect may be present; or (iv) to reduce the inter-examination observation period. When ancillary studies are used, a second clinical examination and apnea test should be performed and components that can be completed must remain consistent with brain death. In this instance the observation interval may be shortened and the second neurologic examination and apnea test (or all components that are able to be completed safely) can be performed at any time thereafter.

(6) Death is declared when the above criteria are fulfilled. (8/11)

GUIDELINES FOR THE ETHICAL CONDUCT OF STUDIES TO EVALUATE DRUGS IN PEDIATRIC POPULATIONS (CLINICAL REPORT)

Robert E. Shaddy, MD; Scott C. Denne, MD; Committee on Drugs; and Committee on Pediatric Research

ABSTRACT. The proper ethical conduct of studies to evaluate drugs in children is of paramount importance to all those involved in these types of studies. This report is an updated revision to the previously published guidelines from the American Academy of Pediatrics in 1995. Since the previous publication, there have been great strides made in the science and ethics of studying drugs in children. There have also been numerous legislative and regulatory advancements that have promoted the study of drugs in children while simultaneously allowing for the protection of this particularly vulnerable group. This report summarizes these changes and advances and provides a framework from which to guide and monitor the ethical conduct of studies to evaluate drugs in children. (3/10, reaffirmed 1/14)

GUIDELINES ON FORGOING LIFE-SUSTAINING MEDICAL TREATMENT

Committee on Bioethics (3/94, reaffirmed 11/97, 10/00, 1/04, 1/09, 10/12)

GUIDING PRINCIPLES FOR MANAGED CARE ARRANGEMENTS FOR THE HEALTH CARE OF NEWBORNS, INFANTS, CHILDREN, ADOLESCENTS, AND YOUNG ADULTS

Committee on Child Health Financing

ABSTRACT. By including the precepts of primary care and the medical home in the delivery of services, managed care can be effective in increasing access to a full range of health care services and clinicians. A carefully

designed and administered managed care plan can minimize patient under- and overutilization of services, as well as enhance quality of care. Therefore, the American Academy of Pediatrics urges the use of the key principles outlined in this statement in designing and implementing managed care programs for newborns, infants, children, adolescents, and young adults to maximize the positive potential of managed care for pediatrics. (10/13)

GUIDING PRINCIPLES FOR PEDIATRIC HOSPITAL MEDICINE PROGRAMS

Section on Hospital Medicine

ABSTRACT. Pediatric hospital medicine programs have an established place in pediatric medicine. This statement speaks to the expanded roles and responsibilities of pediatric hospitalists and their integrated role among the community of pediatricians who care for children within and outside of the hospital setting. (9/13)

GYNECOLOGIC EXAMINATION FOR ADOLESCENTS IN THE PEDIATRIC OFFICE SETTING (CLINICAL REPORT)

Paula K. Braverman, MD; Lesley Breech, MD; and Committee on Adolescence

ABSTRACT. The American Academy of Pediatrics promotes the inclusion of the gynecologic examination in the primary care setting within the medical home. Gynecologic issues are commonly seen by clinicians who provide primary care to adolescents. Some of the most common concerns include questions related to pubertal development; menstrual disorders such as dysmenorrhea, amenorrhea, oligomenorrhea, and abnormal uterine bleeding; contraception; and sexually transmitted and non-sexually transmitted infections. The gynecologic examination is a key element in assessing pubertal status and documenting physical findings. Most adolescents do not need an internal examination involving a speculum or bimanual examination. However, for cases in which more extensive examination is needed, the primary care office with the primary care clinician who has established rapport and trust with the patient is often the best setting for pelvic examination. This report reviews the gynecologic examination, including indications for the pelvic examination in adolescents and the approach to this examination in the office setting. Indications for referral to a gynecologist are included. The pelvic examination may be successfully completed when conducted without pressure and approached as a normal part of routine young women's health care. (8/10, reaffirmed 5/13)

HEAD LICE (CLINICAL REPORT)

Barbara L. Frankowski, MD, MPH; Joseph A. Bocchini, Jr, MD; Council on School Health; and Committee on Infectious Diseases

ABSTRACT. Head lice infestation is associated with limited morbidity but causes a high level of anxiety among parents of school-aged children. Since the 2002 clinical report on head lice was published by the American Academy of Pediatrics, patterns of resistance to products available over-the-counter and by prescription have changed, and additional mechanical means of removing head lice have been explored. This revised clinical report clarifies current diagnosis and treatment protocols and

provides guidance for the management of children with head lice in the school setting. (7/10)

HEALTH AND MENTAL HEALTH NEEDS OF CHILDREN IN US MILITARY FAMILIES (CLINICAL REPORT)

Benjamin S. Siegel, MD; Beth Ellen Davis, MD, MPH;

Committee on Psychosocial Aspects of Child and Family Health; and Section on Uniformed Services

ABSTRACT. The wars in Afghanistan and Iraq have been challenging for US uniformed service families and their children. Almost 60% of US service members have family responsibilities. Approximately 2.3 million active duty, National Guard, and Reserve service members have been deployed since the beginning of the wars in Afghanistan and Iraq (2001 and 2003, respectively), and almost half have deployed more than once, some for up to 18 months' duration. Up to 2 million US children have been exposed to a wartime deployment of a loved one in the past 10 years. Many service members have returned from combat deployments with symptoms of posttraumatic stress disorder, depression, anxiety, substance abuse, and traumatic brain injury. The mental health and well-being of spouses, significant others, children (and their friends), and extended family members of deployed service members continues to be significantly challenged by the experiences of wartime deployment as well as by combat mortality and morbidity. The medical system of the Department of Defense provides health and mental health services for active duty service members and their families as well as activated National Guard and Reserve service members and their families. In addition to military pediatricians and civilian pediatricians employed by military treatment facilities, nonmilitary general pediatricians care for >50% of children and family members before, during, and after wartime deployments. This clinical report is for all pediatricians, both active duty and civilian, to aid in caring for children whose loved ones have been, are, or will be deployed. (5/13)

HEALTH CARE FOR YOUTH IN THE JUVENILE JUSTICE SYSTEM

Committee on Adolescence

ABSTRACT. Youth in the juvenile correctional system are a high-risk population who, in many cases, have unmet physical, developmental, and mental health needs. Multiple studies have found that some of these health issues occur at higher rates than in the general adolescent population. Although some youth in the juvenile justice system have interfaced with health care providers in their community on a regular basis, others have had inconsistent or nonexistent care. The health needs of these youth are commonly identified when they are admitted to a juvenile custodial facility. Pediatricians and other health care providers play an important role in the care of these youth, and continuity between the community and the correctional facility is crucial. This policy statement provides an overview of the health needs of youth in the juvenile correctional system, including existing resources and standards for care, financing of health care within correctional facilities, and evidence-based interventions. Recommendations are provided for the provision of health

care services to youth in the juvenile correctional system as well as specific areas for advocacy efforts. (11/11)

HEALTH CARE OF YOUTH AGING OUT OF FOSTER CARE

Council on Foster Care, Adoption, and Kinship Care and Committee on Early Childhood

ABSTRACT. Youth transitioning out of foster care face significant medical and mental health care needs. Unfortunately, these youth rarely receive the services they need because of lack of health insurance. Through many policies and programs, the federal government has taken steps to support older youth in foster care and those aging out. The Fostering Connections to Success and Increasing Adoptions Act of 2008 (Pub L No. 110-354) requires states to work with youth to develop a transition plan that addresses issues such as health insurance. In addition, beginning in 2014, the Patient Protection and Affordable Care Act of 2010 (Pub L No. 111-148) makes youth aging out of foster care eligible for Medicaid coverage until age 26 years, regardless of income. Pediatricians can support youth aging out of foster care by working collaboratively with the child welfare agency in their state to ensure that the ongoing health needs of transitioning youth are met. (11/12)

HEALTH CARE SUPERVISION FOR CHILDREN WITH WILLIAMS SYNDROME

Committee on Genetics

ABSTRACT. This set of guidelines is designed to assist the pediatrician to care for children with Williams syndrome diagnosed by clinical features and with regional chromosomal microdeletion confirmed by fluorescence in situ hybridization. (5/01, reaffirmed 5/05, 1/09)

HEALTH EQUITY AND CHILDREN'S RIGHTS

Council on Community Pediatrics and Committee on Native American Child Health

ABSTRACT. Many children in the United States fail to reach their full health and developmental potential. Disparities in their health and well-being result from the complex interplay of multiple social and environmental determinants that are not adequately addressed by current standards of pediatric practice or public policy. Integrating the principles and practice of child health equity—children's rights, social justice, human capital investment, and health equity ethics—into pediatrics will address the root causes of child health disparities.

Promoting the principles and practice of equity-based clinical care, child advocacy, and child- and family-centered public policy will help to ensure that social and environmental determinants contribute positively to the health and well-being of children. The American Academy of Pediatrics and pediatricians can move the national focus from documenting child health disparities to advancing the principles and practice of child health equity and, in so doing, influence the worldwide practice of pediatrics and child health. All pediatricians, including primary care practitioners and medical and surgical subspecialists, can incorporate these principles into their practice of pediatrics and child health. Integration of these

principles into competency-based training and board certification will secure their assimilation into all levels of pediatric practice. (3/10, reaffirmed 10/13)

HEALTH INFORMATION TECHNOLOGY AND THE MEDICAL HOME

Council on Clinical Information Technology

ABSTRACT. The American Academy of Pediatrics (AAP) supports development and universal implementation of a comprehensive electronic infrastructure to support pediatric information functions of the medical home. These functions include (1) timely and continuous management and tracking of health data and services over a patient's lifetime for all providers, patients, families, and guardians, (2) comprehensive organization and secure transfer of health data during patient-care transitions between providers, institutions, and practices, (3) establishment and maintenance of central coordination of a patient's health information among multiple repositories (including personal health records and information exchanges), (4) translation of evidence into actionable clinical decision support, and (5) reuse of archived clinical data for continuous quality improvement. The AAP supports universal, secure, and vendor-neutral portability of health information for all patients contained within the medical home across all care settings (ambulatory practices, inpatient settings, emergency departments, pharmacies, consultants, support service providers, and therapists) for multiple purposes including direct care, personal health records, public health, and registries. The AAP also supports financial incentives that promote the development of information tools that meet the needs of pediatric workflows and that appropriately recognize the added value of medical homes to pediatric care. (4/11)

HEALTH SUPERVISION FOR CHILDREN WITH ACHONDROPLASIA (CLINICAL REPORT)

Tracy L. Trotter, MD; Judith G. Hall, OC, MD; and Committee on Genetics

ABSTRACT. Achondroplasia is the most common condition associated with disproportionate short stature. Substantial information is available concerning the natural history and anticipatory health supervision needs in children with this dwarfing disorder. Most children with achondroplasia have delayed motor milestones, problems with persistent or recurrent middle-ear dysfunction, and bowing of the lower legs. Less often, infants and children may have serious health consequences related to hydrocephalus, craniocervical junction compression, upper-airway obstruction, or thoracolumbar kyphosis. Anticipatory care should be directed at identifying children who are at high risk and intervening to prevent serious sequelae. This report is designed to help the pediatrician care for children with achondroplasia and their families. (9/05, reaffirmed 5/12)

HEALTH SUPERVISION FOR CHILDREN WITH DOWN SYNDROME (CLINICAL REPORT)

Marilyn J. Bull, MD, and Committee on Genetics

ABSTRACT. These guidelines are designed to assist the pediatrician in caring for the child in whom a diagnosis of Down syndrome has been confirmed by chromosome analysis. Although a pediatrician's initial contact with the child is usually during infancy, occasionally the pregnant woman who has been given a prenatal diagnosis of Down syndrome will be referred for review of the condition and the genetic counseling provided. Therefore, this report offers guidance for this situation as well. (7/11)

HEALTH SUPERVISION FOR CHILDREN WITH FRAGILE X SYNDROME (CLINICAL REPORT)

Joseph H. Hersh, MD; Robert A. Saul, MD; and Committee on Genetics

ABSTRACT. Fragile X syndrome (an FMR1-related disorder) is the most commonly inherited form of mental retardation. Early physical recognition is difficult, so boys with developmental delay should be strongly considered for molecular testing. The characteristic adult phenotype usually does not develop until the second decade of life. Girls can also be affected with developmental delay. Because multiple family members can be affected with mental retardation and other conditions (premature ovarian failure and tremor/ataxia), family history information is of critical importance for the diagnosis and management of affected patients and their families. This report summarizes issues for fragile X syndrome regarding clinical diagnosis, laboratory diagnosis, genetic counseling, related health problems, behavior management, and age-related health supervision guidelines. The diagnosis of fragile X syndrome not only involves the affected children but also potentially has significant health consequences for multiple generations in each family. (4/11)

HEALTH SUPERVISION FOR CHILDREN WITH MARFAN SYNDROME (CLINICAL REPORT)

Brad T. Tinkle, MD, PhD; Howard M. Saal, MD; and Committee on Genetics

ABSTRACT. Marfan syndrome is a systemic, heritable connective tissue disorder that affects many different organ systems and is best managed by using a multidisciplinary approach. The guidance in this report is designed to assist the pediatrician in recognizing the features of Marfan syndrome as well as caring for the individual with this disorder. (9/13)

HEALTH SUPERVISION FOR CHILDREN WITH NEUROFIBROMATOSIS (CLINICAL REPORT)

Joseph H. Hersh, MD, and Committee on Genetics

ABSTRACT. Neurofibromatosis 1 is a multisystem disorder that primarily involves the skin and nervous system. Its population prevalence is 1 in 3500. The condition usually is recognized in early childhood, when cutaneous manifestations are apparent. Although neurofibromatosis 1 is associated with marked clinical variability, most affected children do well from the standpoint of their growth and development. Some features of neurofibromatosis 1 are present at birth, and others are age-related

abnormalities of tissue proliferation, which necessitate periodic monitoring to address ongoing health and developmental needs and to minimize the risk of serious medical complications. This clinical report provides a review of the clinical criteria needed to establish a diagnosis, the inheritance pattern of neurofibromatosis 1, its major clinical and developmental manifestations, and guidelines for monitoring and providing intervention to maximize the growth, development, and health of an affected child. (3/08)

HEALTH SUPERVISION FOR CHILDREN WITH PRADER-WILLI SYNDROME (CLINICAL REPORT)

Shawn E. McCandless, MD, and Committee on Genetics

ABSTRACT. This set of guidelines was designed to assist the pediatrician in caring for children with Prader-Willi syndrome diagnosed by clinical features and confirmed by molecular testing. Prader-Willi syndrome provides an excellent example of how early diagnosis and management can improve the long-term outcome for some genetic disorders. (12/10)

HEALTH SUPERVISION FOR CHILDREN WITH SICKLE CELL DISEASE

Section on Hematology/Oncology and Committee on Genetics

ABSTRACT. Sickle cell disease (SCD) is a group of complex genetic disorders with multisystem manifestations. This statement provides pediatricians in primary care and subspecialty practice with an overview of the genetics, diagnosis, clinical manifestations, and treatment of SCD. Specialized comprehensive medical care decreases morbidity and mortality during childhood. The provision of comprehensive care is a time-intensive endeavor that includes ongoing patient and family education, periodic comprehensive evaluations and other disease-specific health maintenance services, psychosocial care, and genetic counseling. Timely and appropriate treatment of acute illness is critical, because life-threatening complications develop rapidly. It is essential that every child with SCD receive comprehensive care that is coordinated through a medical home with appropriate expertise. (3/02, reaffirmed 1/06, 1/11)

HEARING ASSESSMENT IN INFANTS AND CHILDREN: RECOMMENDATIONS

BEYOND NEONATAL SCREENING (CLINICAL REPORT)

Allen D. "Buz" Harlor Jr, MD; Charles Bower, MD;

Committee on Practice and Ambulatory Medicine; and

Section on Otolaryngology–Head and Neck Surgery

ABSTRACT. Congenital or acquired hearing loss in infants and children has been linked with lifelong deficits in speech and language acquisition, poor academic performance, personal-social maladjustments, and emotional difficulties. Identification of hearing loss through neonatal hearing screening, regular surveillance of developmental milestones, auditory skills, parental concerns, and middle-ear status and objective hearing screening of all infants and children at critical developmental stages can prevent or reduce many of these adverse consequences. This report promotes a proactive, consistent, and explicit

process for the early identification of children with hearing loss in the medical home. An algorithm of the recommended approach has been developed to assist in the detection and documentation of, and intervention for, hearing loss. (9/09)

HELPING CHILDREN AND FAMILIES DEAL WITH DIVORCE AND SEPARATION (CLINICAL REPORT)

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. More than 1 million children each year experience their parents' divorce. For these children and their parents, this process can be emotionally traumatic from the beginning of parental disagreement and rancor, through the divorce, and often for many years thereafter. Pediatricians are encouraged to be aware of behavioral changes in their patients that might be signals of family dysfunction so they can help parents and children understand and deal more positively with the issue. Age-appropriate explanation and counseling is important so children realize that they are not the cause of, and cannot be the cure for, the divorce. Pediatricians can offer families guidance in dealing with their children through the troubled time as well as appropriate lists of reading material and, if indicated, can refer them to professionals with expertise in the emotional, social, and legal aspects of divorce and its aftermath. (11/02, reaffirmed 1/06)

HIGH-DEDUCTIBLE HEALTH PLANS

Committee on Child Health Financing

ABSTRACT. High-deductible health plans (HDHPs) are insurance policies with higher deductibles than conventional plans. The Medicare Prescription Drug Improvement and Modernization Act of 2003 linked many HDHPs with tax-advantaged spending accounts. The 2010 Patient Protection and Affordable Care Act continues to provide for HDHPs in its lower-level plans on the health insurance marketplace and provides for them in employer-offered plans. HDHPs decrease the premium cost of insurance policies for purchasers and shift the risk of further payments to the individual subscriber. HDHPs reduce utilization and total medical costs, at least in the short term. Because HDHPs require out-of-pocket payment in the initial stages of care, primary care and other outpatient services as well as elective procedures are the services most affected, whereas higher-cost services in the health care system, incurred after the deductible is met, are unaffected. HDHPs promote adverse selection because healthier and wealthier patients tend to opt out of conventional plans in favor of HDHPs. Because the ill pay more than the healthy under HDHPs, families with children with special health care needs bear an increased cost burden in this model. HDHPs discourage use of nonpreventive primary care and thus are at odds with most recommendations for improving the organization of health care, which focus on strengthening primary care.

This policy statement provides background information on HDHPs, discusses the implications for families and pediatric care providers, and suggests courses of action. (4/14)

See full text on page 681.

HIGH-DEDUCTIBLE HEALTH PLANS AND THE NEW RISKS OF CONSUMER-DRIVEN HEALTH INSURANCE PRODUCTS

Committee on Child Health Financing

ABSTRACT. Consumer-driven health care is the most noteworthy development in health insurance since the widespread adoption of health maintenance organizations and preferred provider organizations in the 1980s. The most common consumer-driven health plan is the high-deductible health plan, which is essentially a catastrophic health insurance plan, often linked with tax-advantaged spending accounts, with very high deductibles, fewer benefits, and higher cost-sharing than conventional health maintenance organization or preferred provider organization plans. The financial risks are significant under high-deductible health plans, especially for low- to moderate-income families and for families whose children have special health care needs. Of concern for pediatricians are the potential quality risks that are predictable in high-deductible health plans, in which families are likely to delay or avoid seeking care, especially preventive care (if it is not exempted from the deductible), when they are faced with paying for care before the deductible is met. This policy statement provides background information on the most common consumer-driven health plan model, discusses the implications for pediatricians and families, and offers recommendations pertaining to health plan product design, education, practice administration, and research. (3/07)

HIV TESTING AND PROPHYLAXIS TO PREVENT MOTHER-TO-CHILD TRANSMISSION IN THE UNITED STATES

Committee on Pediatric AIDS

ABSTRACT. Universal HIV testing of pregnant women in the United States is the key to prevention of mother-to-child transmission of HIV. Repeat testing in the third trimester and rapid HIV testing at labor and delivery are additional strategies to further reduce the rate of perinatal HIV transmission. Prevention of mother-to-child transmission of HIV is most effective when antiretroviral drugs are received by the mother during her pregnancy and continued through delivery and then administered to the infant after birth. Antiretroviral drugs are effective in reducing the risk of mother-to-child transmission of HIV even when prophylaxis is started for the infant soon after birth. New rapid testing methods allow identification of HIV-infected women or HIV-exposed infants in 20 to 60 minutes. The American Academy of Pediatrics recommends documented, routine HIV testing for all pregnant women in the United States after notifying the patient that testing will be performed, unless the patient declines HIV testing ("opt-out" consent or "right of refusal"). For women in labor with undocumented HIV-infection status during the current pregnancy, immediate maternal HIV testing with opt-out consent, using a rapid HIV antibody test, is recommended. Positive HIV antibody screening test results should be confirmed with immunofluorescent antibody or Western blot assay. For women with a positive rapid HIV antibody test result, antiretroviral prophylaxis should be administered promptly to the mother and newborn infant

on the basis of the positive result of the rapid antibody test without waiting for results of confirmatory HIV testing. If the confirmatory test result is negative, then prophylaxis should be discontinued. For a newborn infant whose mother's HIV serostatus is unknown, the health care professional should perform rapid HIV antibody testing on the mother or on the newborn infant, with results reported to the health care professional no later than 12 hours after the infant's birth. If the rapid HIV antibody test result is positive, antiretroviral prophylaxis should be instituted as soon as possible after birth but certainly by 12 hours after delivery, pending completion of confirmatory HIV testing. The mother should be counseled not to breastfeed the infant. Assistance with immediate initiation of hand and pump expression to stimulate milk production should be offered to the mother, given the possibility that the confirmatory test result may be negative. If the confirmatory test result is negative, then prophylaxis should be stopped and breastfeeding may be initiated. If the confirmatory test result is positive, infants should receive antiretroviral prophylaxis for 6 weeks after birth, and the mother should not breastfeed the infant. (11/08, reaffirmed 6/11)

HOME, HOSPITAL, AND OTHER NON-SCHOOL-BASED INSTRUCTION FOR CHILDREN AND ADOLESCENTS WHO ARE MEDICALLY UNABLE TO ATTEND SCHOOL

Committee on School Health

ABSTRACT. The American Academy of Pediatrics recommends that school-aged children and adolescents obtain their education in school in the least restrictive setting, that is, the setting most conducive to learning for the particular student. However, at times, acute illness or injury and chronic medical conditions preclude school attendance. This statement is meant to assist evaluation and planning for children to receive non-school-based instruction and to return to school at the earliest possible date. (11/00, reaffirmed 6/03, 5/06)

HOME CARE OF CHILDREN AND YOUTH WITH COMPLEX HEALTH CARE NEEDS AND TECHNOLOGY DEPENDENCIES (CLINICAL REPORT)

Ellen Roy Elias, MD; Nancy A. Murphy, MD; and Council on Children With Disabilities

ABSTRACT. Children and youth with complex medical issues, especially those with technology dependencies, experience frequent and often lengthy hospitalizations. Hospital discharges for these children can be a complicated process that requires a deliberate, multistep approach. In addition to successful discharges to home, it is essential that pediatric providers develop and implement an interdisciplinary and coordinated plan of care that addresses the child's ongoing health care needs. The goal is to ensure that each child remains healthy, thrives, and obtains optimal medical home and developmental supports that promote ongoing care at home and minimize recurrent hospitalizations. This clinical report presents an approach to discharging the child with complex medical needs with technology dependencies from hospital to home and then continually addressing the needs of the child and family in the home environment. (4/12)

HONORING DO-NOT-ATTEMPT-RESUSCITATION REQUESTS IN SCHOOLS

Council on School Health and Committee on Bioethics

ABSTRACT. Increasingly, children and adolescents with complex chronic conditions are living in the community. Federal legislation and regulations facilitate their participation in school. Some of these children and adolescents and their families may wish to forego life-sustaining medical treatment, including cardiopulmonary resuscitation, because they would be ineffective or because the risks outweigh the benefits. Honoring these requests in the school environment is complex because of the limited availability of school nurses and the frequent lack of supporting state legislation and regulations. Understanding and collaboration on the part of all parties is essential. Pediatricians have an important role in helping school nurses incorporate a specific action plan into the student's individualized health care plan. The action plan should include both communication and comfort-care plans. Pediatricians who work directly with schools can also help implement policies, and professional organizations can advocate for regulations and legislation that enable students and their families to effectuate their preferences. (4/10, reaffirmed 7/13)

HOSPITAL DISCHARGE OF THE HIGH-RISK NEONATE

Committee on Fetus and Newborn

ABSTRACT. This policy statement updates the guidelines on discharge of the high-risk neonate first published by the American Academy of Pediatrics in 1998. As with the earlier document, this statement is based, insofar as possible, on published, scientifically derived information. This updated statement incorporates new knowledge about risks and medical care of the high-risk neonate, the timing of discharge, and planning for care after discharge. It also refers to other American Academy of Pediatrics publications that are relevant to these issues. This statement draws on the previous classification of high-risk infants into 4 categories: (1) the preterm infant; (2) the infant with special health care needs or dependence on technology; (3) the infant at risk because of family issues; and (4) the infant with anticipated early death. The issues of deciding when discharge is appropriate, defining the specific needs for follow-up care, and the process of detailed discharge planning are addressed as they apply in general to all 4 categories; in addition, special attention is directed to the particular issues presented by the 4 individual categories. Recommendations are given to aid in deciding when discharge is appropriate and to ensure that all necessary care will be available and well coordinated after discharge. The need for individualized planning and physician judgment is emphasized. (11/08, reaffirmed 5/11)

THE HOSPITAL RECORD OF THE INJURED CHILD AND THE NEED FOR EXTERNAL CAUSE-OF-INJURY CODES

Committee on Injury and Poison Prevention

ABSTRACT. Proper record-keeping of emergency department visits and hospitalizations of injured children is vital for appropriate patient management. Determination and documentation of the circumstances surrounding the injury event are essential. This information not only is the

basis for preventive counseling, but also provides clues about how similar injuries in other youth can be avoided. The hospital records have an important secondary purpose; namely, if sufficient information about the cause and mechanism of injury is documented, it can be subsequently coded, electronically compiled, and retrieved later to provide an epidemiologic profile of the injury, the first step in prevention at the population level. To be of greatest use, hospital records should indicate the "who, what, when, where, why, and how" of the injury occurrence and whether protective equipment (eg, a seat belt) was used. The pediatrician has two important roles in this area: to document fully the injury event and to advocate the use of standardized external cause-of-injury codes, which allow such data to be compiled and analyzed. (2/99, reaffirmed 5/02, 5/05, 10/08, 10/13)

HOSPITAL STAY FOR HEALTHY TERM NEWBORNS

Committee on Fetus and Newborn

ABSTRACT. The hospital stay of the mother and her healthy term newborn infant should be long enough to allow identification of early problems and to ensure that the family is able and prepared to care for the infant at home. The length of stay should also accommodate the unique characteristics of each mother-infant dyad, including the health of the mother, the health and stability of the infant, the ability and confidence of the mother to care for her infant, the adequacy of support systems at home, and access to appropriate follow-up care. Input from the mother and her obstetrician should be considered before a decision to discharge a newborn is made, and all efforts should be made to keep mothers and infants together to promote simultaneous discharge. (1/10)

HPV VACCINE RECOMMENDATIONS

Committee on Infectious Diseases

ABSTRACT. On October 25, 2011, the Advisory Committee on Immunization Practices of the Centers for Disease Control and Prevention recommended that the quadrivalent human papillomavirus vaccine (Gardasil; Merck & Co, Inc, Whitehouse Station, NJ) be used routinely in males. The American Academy of Pediatrics has reviewed updated data provided by the Advisory Committee on Immunization Practices on vaccine efficacy, safety, and cost-effectiveness as well as programmatic considerations and supports this recommendation. This revised statement updates recommendations for human papillomavirus immunization of both males and females. (2/12)

HUMAN EMBRYONIC STEM CELL (hESC) AND HUMAN EMBRYO RESEARCH

Committee on Pediatric Research and Committee on Bioethics

ABSTRACT. Human embryonic stem cell research has emerged as an important platform for the understanding and treatment of pediatric diseases. From its inception, however, it has raised ethical concerns based not on the use of stem cells themselves but on objections to the source of the cells—specifically, the destruction of preimplantation human embryos. Despite differences in public opinion on this issue, a large majority of the public supports continued research using embryonic stem cells.

Given the possible substantial benefit of stem cell research on child health and development, the American Academy of Pediatrics believes that funding and oversight for human embryo and embryonic stem cell research should continue. (10/12)

HUMAN IMMUNODEFICIENCY VIRUS AND OTHER BLOOD-BORNE VIRAL PATHOGENS IN THE ATHLETIC SETTING

Committee on Sports Medicine and Fitness

ABSTRACT. Because athletes and the staff of athletic programs can be exposed to blood during athletic activity, they have a very small risk of becoming infected with human immunodeficiency virus, hepatitis B virus, or hepatitis C virus. This statement, which updates a previous position statement of the American Academy of Pediatrics, discusses sports participation for athletes infected with these pathogens and the precautions needed to reduce the risk of infection to others in the athletic setting. Each of the recommendations in this statement is dependent upon and intended to be considered with reference to the other recommendations in this statement and not in isolation. (12/99, reaffirmed 1/05, 1/09, 11/11)

HUMAN IMMUNODEFICIENCY VIRUS SCREENING

Committee on Fetus and Newborn and Committee on Pediatric AIDS (joint with American College of Obstetricians and Gynecologists) (7/99, reaffirmed 6/02, 5/05, 10/08, 5/12)

HUMAN MILK, BREASTFEEDING, AND TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS IN THE UNITED STATES

Committee on Pediatric AIDS (11/95, reaffirmed 11/99, 11/03, 2/08)

HUMAN MILK, BREASTFEEDING, AND TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS TYPE 1 IN THE UNITED STATES (TECHNICAL REPORT)

Committee on Pediatric AIDS

ABSTRACT. Transmission of human immunodeficiency virus type 1 (HIV-1) through breastfeeding has been conclusively demonstrated. The risk of such transmission has been quantified, the timing has been clarified, and certain risk factors for breastfeeding transmission have been identified. In areas where infant formula is accessible, affordable, safe, and sustainable, avoidance of breastfeeding has represented one of the main components of mother-to-child HIV-1 transmission prevention efforts for many years. In areas where affordable and safe alternatives to breastfeeding may not be available, interventions to prevent breastfeeding transmission are being investigated. Complete avoidance of breastfeeding by HIV-1-infected women has been recommended by the American Academy of Pediatrics and the Centers for Disease Control and Prevention and remains the only means by which prevention of breastfeeding transmission of HIV-1 can be absolutely ensured. This technical report summarizes the information available regarding breastfeeding transmission of HIV-1. (11/03, reaffirmed 1/07)

HYPOTHERMIA AND NEONATAL ENCEPHALOPATHY (CLINICAL REPORT)

Committee on Fetus and Newborn

ABSTRACT. Data from large randomized clinical trials indicate that therapeutic hypothermia, using either selective head cooling or systemic cooling, is an effective therapy for neonatal encephalopathy. Infants selected for cooling must meet the criteria outlined in published clinical trials. The implementation of cooling needs to be performed at centers that have the capability to manage medically complex infants. Because the majority of infants who have neonatal encephalopathy are born at community hospitals, centers that perform cooling should work with their referring hospitals to implement education programs focused on increasing the awareness and identification of infants at risk for encephalopathy, and the initial clinical management of affected infants. (5/14)

See full text on page 693.

IDENTIFICATION AND CARE OF HIV-EXPOSED AND HIV-INFECTED INFANTS, CHILDREN, AND ADOLESCENTS IN FOSTER CARE

Committee on Pediatric AIDS

ABSTRACT. As a consequence of the expanding human immunodeficiency virus (HIV) epidemic and major advances in medical management of HIV-exposed and HIV-infected persons, revised recommendations are provided for HIV testing of infants, children, and adolescents in foster care. Updated recommendations also are provided for the care of HIV-exposed and HIV-infected persons who are in foster care. (7/00, reaffirmed 3/03, 2/08, 6/11)

IDENTIFICATION AND EVALUATION OF CHILDREN WITH AUTISM SPECTRUM DISORDERS (CLINICAL REPORT)

Chris Plauché Johnson, MD, MEd; Scott M. Myers, MD; and Council on Children With Disabilities

ABSTRACT. Autism spectrum disorders are not rare; many primary care pediatricians care for several children with autism spectrum disorders. Pediatricians play an important role in early recognition of autism spectrum disorders, because they usually are the first point of contact for parents. Parents are now much more aware of the early signs of autism spectrum disorders because of frequent coverage in the media; if their child demonstrates any of the published signs, they will most likely raise their concerns to their child's pediatrician. It is important that pediatricians be able to recognize the signs and symptoms of autism spectrum disorders and have a strategy for assessing them systematically. Pediatricians also must be aware of local resources that can assist in making a definitive diagnosis of, and in managing, autism spectrum disorders. The pediatrician must be familiar with developmental, educational, and community resources as well as medical subspecialty clinics. This clinical report is 1 of 2 documents that replace the original American Academy of Pediatrics policy statement and technical report published in 2001. This report addresses background information, including definition, history, epidemiology, diagnostic criteria, early signs, neuropathologic aspects, and etiologic possibilities in autism spectrum

disorders. In addition, this report provides an algorithm to help the pediatrician develop a strategy for early identification of children with autism spectrum disorders. The accompanying clinical report addresses the management of children with autism spectrum disorders and follows this report on page 1162 [available at www.pediatrics.org/cgi/content/full/120/5/1162]. Both clinical reports are complemented by the toolkit titled "*Autism: Caring for Children With Autism Spectrum Disorders: A Resource Toolkit for Clinicians*," which contains screening and surveillance tools, practical forms, tables, and parent handouts to assist the pediatrician in the identification, evaluation, and management of autism spectrum disorders in children. (11/07, reaffirmed 9/10, 8/14)

IDENTIFICATION AND MANAGEMENT OF EATING DISORDERS IN CHILDREN AND ADOLESCENTS (CLINICAL REPORT)

David S. Rosen, MD, MPH, and Committee on Adolescence

ABSTRACT. The incidence and prevalence of eating disorders in children and adolescents has increased significantly in recent decades, making it essential for pediatricians to consider these disorders in appropriate clinical settings, to evaluate patients suspected of having these disorders, and to manage (or refer) patients in whom eating disorders are diagnosed. This clinical report includes a discussion of diagnostic criteria and outlines the initial evaluation of the patient with disordered eating. Medical complications of eating disorders may affect any organ system, and careful monitoring for these complications is required. The range of treatment options, including pharmacotherapy, is described in this report. Pediatricians are encouraged to advocate for legislation and policies that ensure appropriate services for patients with eating disorders, including medical care, nutritional intervention, mental health treatment, and care coordination. (11/10)

IDENTIFYING INFANTS AND YOUNG CHILDREN WITH DEVELOPMENTAL DISORDERS IN THE MEDICAL HOME: AN ALGORITHM FOR DEVELOPMENTAL SURVEILLANCE AND SCREENING

Council on Children With Disabilities, Section on Developmental and Behavioral Pediatrics, Bright Futures Steering Committee, and Medical Home Initiatives for Children With Special Needs Project Advisory Committee

ABSTRACT. Early identification of developmental disorders is critical to the well-being of children and their families. It is an integral function of the primary care medical home and an appropriate responsibility of all pediatric health care professionals. This statement provides an algorithm as a strategy to support health care professionals in developing a pattern and practice for addressing developmental concerns in children from birth through 3 years of age. The authors recommend that developmental surveillance be incorporated at every well-child preventive care visit. Any concerns raised during surveillance should be promptly addressed with standardized developmental screening tests. In addition, screening tests should be administered regularly at the 9-, 18-, and 30-month visits. (Because the 30-month visit is not yet a part of the preventive care system and is often not reimbursable by third-

party payers at this time, developmental screening can be performed at 24 months of age. In addition, because the frequency of regular pediatric visits decreases after 24 months of age, a pediatrician who expects that his or her patients will have difficulty attending a 30-month visit should conduct screening during the 24-month visit.) The early identification of developmental problems should lead to further developmental and medical evaluation, diagnosis, and treatment, including early developmental intervention. Children diagnosed with developmental disorders should be identified as children with special health care needs, and chronic-condition management should be initiated. Identification of a developmental disorder and its underlying etiology may also drive a range of treatment planning, from medical treatment of the child to family planning for his or her parents. (7/06, reaffirmed 12/09, 8/14)

IMMERSION IN WATER DURING LABOR AND DELIVERY (CLINICAL REPORT)

Committee on Fetus and Newborn (joint with American College of Obstetricians and Gynecologists Committee on Obstetric Practice)

ABSTRACT. Immersion in water has been suggested as a beneficial alternative for labor, delivery, or both and over the past decades has gained popularity in many parts of the world. Immersion in water during the first stage of labor may be associated with decreased pain or use of anesthesia and decreased duration of labor. However, there is no evidence that immersion in water during the first stage of labor otherwise improves perinatal outcomes, and it should not prevent or inhibit other elements of care. The safety and efficacy of immersion in water during the second stage of labor have not been established, and immersion in water during the second stage of labor has not been associated with maternal or fetal benefit. Given these facts and case reports of rare but serious adverse effects in the newborn, the practice of immersion in the second stage of labor (underwater delivery) should be considered an experimental procedure that only should be performed within the context of an appropriately designed clinical trial with informed consent. Facilities that plan to offer immersion in the first stage of labor need to establish rigorous protocols for candidate selection, maintenance and cleaning of tubs and immersion pools, infection control procedures, monitoring of mothers and fetuses at appropriate intervals while immersed, and immediately and safely moving women out of the tubs if maternal or fetal concerns develop. (3/14)

See full text on page 701.

IMMUNIZATION FOR STREPTOCOCCUS PNEUMONIAE INFECTIONS IN HIGH-RISK CHILDREN

Committee on Infectious Diseases

ABSTRACT. Routine use of the pneumococcal conjugate vaccines (PCV7 and PCV13), beginning in 2000, has resulted in a dramatic reduction in the incidence of invasive pneumococcal disease (IPD) attributable to serotypes of *Streptococcus pneumoniae* contained in the vaccines. The Advisory Committee on Immunization Practices of the Centers for Disease Control and Prevention and the American Academy of Pediatrics recommend the

expanded use of PCV13 in children 6 through 18 years of age with certain conditions that place them at elevated risk of IPD. This statement provides recommendations for the use of PCV13 in children 6 through 18 years. A single dose of PCV13 should be administered to certain children in this age group who are at elevated risk of IPD. Recommendations for the use of PCV13 in healthy children and for pneumococcal polysaccharide vaccine (PPSV23) remain unchanged. (11/14)

See full text on page 707.

IMMUNIZATION INFORMATION SYSTEMS

Committee on Practice and Ambulatory Medicine

ABSTRACT. The American Academy of Pediatrics continues to support the development and implementation of immunization information systems, previously referred to as immunization registries, and other systems for the benefit of children, pediatricians, and their communities. Pediatricians and others must be aware of the value that immunization information systems have for society, the potential fiscal influences on their practice, the costs and benefits, and areas for future improvement. (9/06, reaffirmed 10/11)

IMMUNIZING PARENTS AND OTHER CLOSE FAMILY CONTACTS IN THE PEDIATRIC OFFICE SETTING (TECHNICAL REPORT)

Herschel R. Lessin, MD; Kathryn M. Edwards, MD;

Committee on Practice and Ambulatory Medicine; and

Committee on Infectious Diseases

ABSTRACT. Additional strategies are needed to protect children from vaccine-preventable diseases. In particular, very young infants, as well as children who are immunocompromised, are at especially high risk for developing the serious consequences of vaccine-preventable diseases and cannot be immunized completely. There is some evidence that children who become infected with these diseases are exposed to pathogens through household contacts, particularly from parents or other close family contacts. Such infections likely are attributable to adults who are not fully protected from these diseases, either because their immunity to vaccine-preventable diseases has waned over time or because they have not received a vaccine. There are many challenges that have added to low adult immunization rates in the United States. One option to increase immunization coverage for parents and close family contacts of infants and vulnerable children is to provide alternative locations for these adults to be immunized, such as the pediatric office setting. Ideally, adults should receive immunizations in their medical homes; however, to provide greater protection to these adults and reduce the exposure of children to pathogens, immunizing parents or other adult family contacts in the pediatric office setting could increase immunization coverage for this population to protect themselves as well as children to whom they provide care. (12/11)

IMPACT OF MUSIC, MUSIC LYRICS, AND MUSIC VIDEOS ON CHILDREN AND YOUTH

Council on Communications and Media

ABSTRACT. Music plays an important role in the socialization of children and adolescents. Popular music is pres-

ent almost everywhere, and it is easily available through the radio, various recordings, the Internet, and new technologies, allowing adolescents to hear it in diverse settings and situations, alone or shared with friends. Parents often are unaware of the lyrics to which their children are listening because of the increasing use of downloaded music and headphones. Research on popular music has explored its effects on schoolwork, social interactions, mood and affect, and particularly behavior. The effect that popular music has on children's and adolescents' behavior and emotions is of paramount concern. Lyrics have become more explicit in their references to drugs, sex, and violence over the years, particularly in certain genres. A teenager's preference for certain types of music could be correlated or associated with certain behaviors. As with popular music, the perception and the effect of music-video messages are important, because research has reported that exposure to violence, sexual messages, sexual stereotypes, and use of substances of abuse in music videos might produce significant changes in behaviors and attitudes of young viewers. Pediatricians and parents should be aware of this information. Furthermore, with the evidence portrayed in these studies, it is essential for pediatricians and parents to take a stand regarding music lyrics. (10/09)

THE IMPACT OF SOCIAL MEDIA ON CHILDREN, ADOLESCENTS, AND FAMILIES (CLINICAL REPORT)

Geonn Schurgin O'Keeffe, MD; Kathleen Clarke-Pearson,

MD; and Council on Communications and Media

ABSTRACT. Using social media Web sites is among the most common activity of today's children and adolescents. Any Web site that allows social interaction is considered a social media site, including social networking sites such as Facebook, MySpace, and Twitter; gaming sites and virtual worlds such as Club Penguin, Second Life, and the Sims; video sites such as YouTube; and blogs. Such sites offer today's youth a portal for entertainment and communication and have grown exponentially in recent years. For this reason, it is important that parents become aware of the nature of social media sites, given that not all of them are healthy environments for children and adolescents. Pediatricians are in a unique position to help families understand these sites and to encourage healthy use and urge parents to monitor for potential problems with cyberbullying, "Facebook depression," sexting, and exposure to inappropriate content. (3/11)

THE IMPORTANCE OF PLAY IN PROMOTING HEALTHY CHILD DEVELOPMENT AND MAINTAINING STRONG PARENT-CHILD BONDS (CLINICAL REPORT)

Kenneth R. Ginsburg, MD, MEd; Committee on

Communications; and Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. Play is essential to development because it contributes to the cognitive, physical, social, and emotional well-being of children and youth. Play also offers an ideal opportunity for parents to engage fully with their children. Despite the benefits derived from play for both children and parents, time for free play has been markedly reduced for some children. This report addresses a variety of factors that have reduced play, including a hurried lifestyle, changes in family structure, and increased atten-

tion to academics and enrichment activities at the expense of recess or free child-centered play. This report offers guidelines on how pediatricians can advocate for children by helping families, school systems, and communities consider how best to ensure that play is protected as they seek the balance in children's lives to create the optimal developmental milieu. (1/07)

THE IMPORTANCE OF PLAY IN PROMOTING HEALTHY CHILD DEVELOPMENT AND MAINTAINING STRONG PARENT-CHILD BOND: FOCUS ON CHILDREN IN POVERTY (CLINICAL REPORT)

*Regina M. Milteer, MD; Kenneth R. Ginsburg, MD, MEd;
Council on Communications and Media; and Committee on
Psychosocial Aspects of Child and Family Health*

ABSTRACT. Play is essential to the social, emotional, cognitive, and physical well-being of children beginning in early childhood. It is a natural tool for children to develop resiliency as they learn to cooperate, overcome challenges, and negotiate with others. Play also allows children to be creative. It provides time for parents to be fully engaged with their children, to bond with their children, and to see the world from the perspective of their child. However, children who live in poverty often face socioeconomic obstacles that impede their rights to have playtime, thus affecting their healthy social-emotional development. For children who are underresourced to reach their highest potential, it is essential that parents, educators, and pediatricians recognize the importance of lifelong benefits that children gain from play. (12/11)

IMPROVING SUBSTANCE ABUSE PREVENTION, ASSESSMENT, AND TREATMENT FINANCING FOR CHILDREN AND ADOLESCENTS

*Committee on Child Health Financing and Committee on
Substance Abuse*

ABSTRACT. The numbers of children, adolescents, and families affected by substance abuse have sharply increased since the early 1990s. The American Academy of Pediatrics recognizes the scope and urgency of this problem and has developed this policy statement for consideration by Congress, federal and state agencies, employers, national organizations, health care professionals, health insurers, managed care organizations, advocacy groups, and families. (10/01)

THE INAPPROPRIATE USE OF SCHOOL "READINESS" TESTS

*Committee on Early Childhood, Adoption, and Dependent
Care and Committee on School Health (3/95, reaffirmed
4/98, 1/04, 4/10)*

INCORPORATING RECOGNITION AND MANAGEMENT OF PERINATAL AND POSTPARTUM DEPRESSION INTO PEDIATRIC PRACTICE (CLINICAL REPORT)

*Marian F. Earls, MD, and Committee on Psychosocial Aspects
of Child and Family Health*

ABSTRACT. Every year, more than 400 000 infants are born to mothers who are depressed, which makes perinatal depression the most underdiagnosed obstetric complication in America. Postpartum depression leads to increased costs of medical care, inappropriate medical care, child abuse and neglect, discontinuation of breast-

feeding, and family dysfunction and adversely affects early brain development. Pediatric practices, as medical homes, can establish a system to implement postpartum depression screening and to identify and use community resources for the treatment and referral of the depressed mother and support for the mother-child (dyad) relationship. This system would have a positive effect on the health and well-being of the infant and family. State chapters of the American Academy of Pediatrics, working with state Early Periodic Screening, Diagnosis, and Treatment (EPSDT) and maternal and child health programs, can increase awareness of the need for perinatal depression screening in the obstetric and pediatric periodicity of care schedules and ensure payment. Pediatricians must advocate for workforce development for professionals who care for very young children and for promotion of evidence-based interventions focused on healthy attachment and parent-child relationships. (10/10)

INCREASING ANTIRETROVIRAL DRUG ACCESS FOR CHILDREN WITH HIV INFECTION

*Committee on Pediatric AIDS and Section on International
Child Health*

ABSTRACT. Although there have been great gains in the prevention of pediatric HIV infection and provision of antiretroviral therapy for children with HIV infection in resource-rich countries, many barriers remain to scaling up HIV prevention and treatment for children in resource-limited areas of the world. Appropriate testing technologies need to be made more widely available to identify HIV infection in infants. Training of practitioners in the skills required to care for children with HIV infection is required to increase the number of children receiving antiretroviral therapy. Lack of availability of appropriate antiretroviral drug formulations that are easily usable and inexpensive is a major impediment to optimal care for children with HIV. The time and energy spent trying to develop liquid antiretroviral formulations might be better used in the manufacture of smaller pill sizes or crushable tablets, which are easier to dispense, transport, store, and administer to children. (4/07, reaffirmed 4/10)

INCREASING IMMUNIZATION COVERAGE

*Committee on Practice and Ambulatory Medicine and Council
on Community Pediatrics*

ABSTRACT. In 1977, the American Academy of Pediatrics issued a statement calling for universal immunization of all children for whom vaccines are not contraindicated. In 1995, the policy statement "Implementation of the Immunization Policy" was published by the American Academy of Pediatrics, followed in 2003 with publication of the first version of this statement, "Increasing Immunization Coverage." Since 2003, there have continued to be improvements in immunization coverage, with progress toward meeting the goals set forth in *Healthy People 2010*. Data from the 2007 National Immunization Survey showed that 90% of children 19 to 35 months of age have received recommended doses of each of the following vaccines: inactivated poliovirus (IPV), measles-mumps-rubella (MMR), varicella-zoster virus (VZB), hepatitis B virus (HBV), and *Haemophilus influenzae* type b (Hib). For diphtheria and tetanus and acellular pertussis

(DTaP) vaccine, 84.5% have received the recommended 4 doses by 35 months of age. Nevertheless, the *Healthy People 2010* goal of at least 80% coverage for the full series (at least 4 doses of DTaP, 3 doses of IPV, 1 dose of MMR, 3 doses of Hib, 3 doses of HBV, and 1 dose of varicella-zoster virus vaccine) has not yet been met, and immunization coverage of adolescents continues to lag behind the goals set forth in *Healthy People 2010*. Despite these encouraging data, a vast number of new challenges that threaten continued success toward the goal of universal immunization coverage have emerged. These challenges include an increase in new vaccines and new vaccine combinations as well as a significant number of vaccines currently under development; a dramatic increase in the acquisition cost of vaccines, coupled with a lack of adequate payment to practitioners to buy and administer vaccines; unanticipated manufacturing and delivery problems that have caused significant shortages of various vaccine products; and the rise of a public antivaccination movement that uses the Internet as well as standard media outlets to advance a position, wholly unsupported by any scientific evidence, linking vaccines with various childhood conditions, particularly autism. Much remains to be accomplished by physician organizations; vaccine manufacturers; third-party payers; the media; and local, state, and federal governments to ensure dependable vaccine supply and payments that are sufficient to continue to provide immunizations in public and private settings and to promote effective strategies to combat unjustified misstatements by the antivaccination movement.

Pediatricians should work individually and collectively at the local, state, and national levels to ensure that all children without a valid contraindication receive all childhood immunizations on time. Pediatricians and pediatric organizations, in conjunction with government agencies such as the Centers for Disease Control and Prevention, must communicate effectively with parents to maximize their understanding of the overall safety and efficacy of vaccines. Most parents and children have not experienced many of the vaccine-preventable diseases, and the general public is not well informed about the risks and sequelae of these conditions. A number of recommendations are included for pediatricians, individually and collectively, to support further progress toward the goal of universal immunization coverage of all children for whom vaccines are not contraindicated. (5/10)

INDICATIONS FOR MANAGEMENT AND REFERRAL OF PATIENTS INVOLVED IN SUBSTANCE ABUSE

Committee on Substance Abuse

ABSTRACT. This statement addresses the challenge of evaluating and managing the various stages of substance use by children and adolescents in the context of pediatric practice. Approaches are suggested that would assist the pediatrician in differentiating highly prevalent experimental and occasional use from more severe use with adverse consequences that affect emotional, behavioral, educational, or physical health. Comorbid psychiatric conditions are common and should be evaluated and treated simultaneously by child and adolescent mental health specialists. Guidelines for referral based on severity of involvement using established patient treatment-match-

ing criteria are outlined. Pediatricians need to become familiar with treatment professionals and facilities in their communities and to ensure that treatment for adolescent patients is appropriate based on their developmental, psychosocial, medical, and mental health needs. The family should be encouraged to participate actively in the treatment process. (7/00)

INFANT FEEDING AND TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS IN THE UNITED STATES

Committee on Pediatric AIDS

ABSTRACT. Physicians caring for infants born to women infected with HIV are likely to be involved in providing guidance to HIV-infected mothers on appropriate infant feeding practices. It is critical that physicians are aware of the HIV transmission risk from human milk and the current recommendations for feeding HIV-exposed infants in the United States. Because the only intervention to completely prevent HIV transmission via human milk is not to breastfeed, in the United States, where clean water and affordable replacement feeding are available, the American Academy of Pediatrics recommends that HIV-infected mothers not breastfeed their infants, regardless of maternal viral load and antiretroviral therapy. (1/13)

INFANT METHEMOGLOBINEMIA: THE ROLE OF DIETARY NITRATE IN FOOD AND WATER (CLINICAL REPORT)

Frank R. Greer, MD; Michael Shannon, MD; Committee on Nutrition; and Committee on Environmental Health

ABSTRACT. Infants for whom formula may be prepared with well water remain a high-risk group for nitrate poisoning. This clinical report reinforces the need for testing of well water for nitrate content. There seems to be little or no risk of nitrate poisoning from commercially prepared infant foods in the United States. However, reports of nitrate poisoning from home-prepared vegetable foods for infants continue to occur. Breastfeeding infants are not at risk of methemoglobinemia even when mothers ingest water with very high concentrations of nitrate nitrogen (100 ppm). (9/05, reaffirmed 4/09)

INFECTION PREVENTION AND CONTROL IN PEDIATRIC AMBULATORY SETTINGS

Committee on Infectious Diseases

ABSTRACT. Since the American Academy of Pediatrics published a statement titled "Infection Control in Physicians' Offices" (*Pediatrics*. 2000;105[6]:1361-1369), there have been significant changes that prompted this updated statement. Infection prevention and control is an integral part of pediatric practice in ambulatory medical settings as well as in hospitals. Infection prevention and control practices should begin at the time the ambulatory visit is scheduled. All health care personnel should be educated regarding the routes of transmission and techniques used to prevent transmission of infectious agents. Policies for infection prevention and control should be written, readily available, updated annually, and enforced. The standard precautions for hospitalized patients from the Centers for Disease Control and Prevention, with a modification from the American Academy of Pediatrics exempting the use of gloves for routine diaper changes and wiping a well child's nose or tears, are appropriate

for most patient encounters. As employers, pediatricians are required by the Occupational Safety and Health Administration to take precautions to identify and protect employees who are likely to be exposed to blood or other potentially infectious materials while on the job. Key principles of standard precautions include hand hygiene (ie, use of alcohol-based hand rub or hand-washing with soap [plain or antimicrobial] and water) before and after every patient contact; implementation of respiratory hygiene and cough-etiquette strategies for patients with suspected influenza or infection with another respiratory tract pathogen to the extent feasible; separation of infected, contagious children from uninfected children when feasible; safe handling and disposal of needles and other sharp medical devices and evaluation and implementation of needle-safety devices; appropriate use of personal protective equipment such as gloves, gowns, masks, and eye protection; and appropriate sterilization, disinfection, and antisepsis. (9/07, reaffirmed 8/10)

INFORMED CONSENT, PARENTAL PERMISSION, AND ASSENT IN PEDIATRIC PRACTICE

Committee on Bioethics (2/95, reaffirmed 11/98, 11/02, 10/06, 5/11)

INHALANT ABUSE (CLINICAL REPORT)

Janet F. Williams, MD; Michael Storck, MD; Committee on Substance Abuse; and Committee on Native American Child Health

ABSTRACT. Inhalant abuse is the intentional inhalation of a volatile substance for the purpose of achieving an altered mental state. As an important, yet-underrecognized form of substance abuse, inhalant abuse crosses all demographic, ethnic, and socioeconomic boundaries, causing significant morbidity and mortality in school-aged and older children. This clinical report reviews key aspects of inhalant abuse, emphasizes the need for greater awareness, and offers advice regarding the pediatrician's role in the prevention and management of this substance abuse problem. (5/07)

INJURIES ASSOCIATED WITH INFANT WALKERS

Committee on Injury and Poison Prevention

ABSTRACT. In 1999, an estimated 8800 children younger than 15 months were treated in hospital emergency departments in the United States for injuries associated with infant walkers. Thirty-four infant walker-related deaths were reported from 1973 through 1998. The vast majority of injuries occur from falls down stairs, and head injuries are common. Walkers do not help a child learn to walk; indeed, they can delay normal motor and mental development. The use of warning labels, public education, adult supervision during walker use, and stair gates have all been demonstrated to be insufficient strategies to prevent injuries associated with infant walkers. To comply with the revised voluntary standard (ASTM F977-96), walkers manufactured after June 30, 1997, must be wider than a 36-in doorway or must have a braking mechanism designed to stop the walker if 1 or more wheels drop off the riding surface, such as at the top of a stairway.

Because data indicate a considerable risk of major and minor injury and even death from the use of infant walkers, and because there is no clear benefit from their use, the American Academy of Pediatrics recommends a ban on the manufacture and sale of mobile infant walkers. If a parent insists on using a mobile infant walker, it is vital that they choose a walker that meets the performance standards of ASTM F977-96 to prevent falls down stairs. Stationary activity centers should be promoted as a safer alternative to mobile infant walkers. (9/01, reaffirmed 1/05, 2/08, 10/11)

INJURIES IN YOUTH SOCCER (CLINICAL REPORT)

Chris G. Koutures, MD; Andrew J. M. Gregory, MD; and Council on Sports Medicine and Fitness

ABSTRACT. Injury rates in youth soccer, known as football outside the United States, are higher than in many other contact/collision sports and have greater relative numbers in younger, preadolescent players. With regard to musculoskeletal injuries, young females tend to suffer more knee injuries, and young males suffer more ankle injuries. Concussions are fairly prevalent in soccer as a result of contact/collision rather than purposeful attempts at heading the ball. Appropriate rule enforcement and emphasis on safe play can reduce the risk of soccer-related injuries. This report serves as a basis for encouraging safe participation in soccer for children and adolescents. (1/10, reaffirmed 5/13)

INJURY RISK OF NONPOWDER GUNS (TECHNICAL REPORT)

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Nonpowder guns (ball-bearing [BB] guns, pellet guns, air rifles, paintball guns) continue to cause serious injuries to children and adolescents. The muzzle velocity of these guns can range from approximately 150 ft/second to 1200 ft/second (the muzzle velocities of traditional firearm pistols are 750 ft/second to 1450 ft/second). Both low- and high-velocity nonpowder guns are associated with serious injuries, and fatalities can result from high-velocity guns. A persisting problem is the lack of medical recognition of the severity of injuries that can result from these guns, including penetration of the eye, skin, internal organs, and bone. Nationally, in 2000, there were an estimated 21840 (coefficient of variation: 0.0821) injuries related to nonpowder guns, with approximately 4% resulting in hospitalization. Between 1990 and 2000, the US Consumer Product Safety Commission reported 39 nonpowder gun-related deaths, of which 32 were children younger than 15 years. The introduction of high-powered air rifles in the 1970s has been associated with approximately 4 deaths per year. The advent of war games and the use of paintball guns have resulted in a number of reports of injuries, especially to the eye. Injuries associated with nonpowder guns should receive prompt medical management similar to the management of firearm-related injuries, and nonpowder guns should never be characterized as toys. (11/04, reaffirmed 2/08, 10/11)

IN-LINE SKATING INJURIES IN CHILDREN AND ADOLESCENTS

Committee on Injury and Poison Prevention and Committee on Sports Medicine and Fitness

ABSTRACT. In-line skating has become one of the fastest-growing recreational sports in the United States. Recent studies emphasize the value of protective gear in reducing the incidence of injuries. Recommendations are provided for parents and pediatricians, with special emphasis on the novice or inexperienced skater. (4/98, reaffirmed 1/02, 1/06, 1/09, 11/11)

INSTITUTIONAL ETHICS COMMITTEES

Committee on Bioethics

ABSTRACT. In hospitals throughout the United States, institutional ethics committees (IECs) have become a standard vehicle for the education of health professionals about biomedical ethics, for the drafting and review of hospital policy, and for clinical ethics case consultation. In addition, there is increasing interest in a role for the IEC in organizational ethics. Recommendations are made about the membership and structure of an IEC, and guidelines are provided for those serving on an ethics committee. (1/01, reaffirmed 1/04, 1/09, 10/12, 7/14)

INSTRUMENT-BASED PEDIATRIC VISION SCREENING POLICY STATEMENT

Section on Ophthalmology and Committee on Practice and Ambulatory Medicine (joint with American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists)

ABSTRACT. A policy statement describing the use of automated vision screening technology (instrument-based vision screening) is presented. Screening for amblyogenic refractive error with instrument-based screening is not dependent on behavioral responses of children, as when visual acuity is measured. Instrument-based screening is quick, requires minimal cooperation of the child, and is especially useful in the preverbal, preliterate, or developmentally delayed child. Children younger than 4 years can benefit from instrument-based screening, and visual acuity testing can be used reliably in older children. Adoption of this new technology is highly dependent on third-party payment policies, which could present a significant barrier to adoption. (10/12)

INSUFFICIENT SLEEP IN ADOLESCENTS AND YOUNG ADULTS: AN UPDATE ON CAUSES AND CONSEQUENCES (TECHNICAL REPORT)

Judith Owens, MD, MPH, FAAP; Adolescent Sleep Working Group; and Committee on Adolescence

ABSTRACT. Chronic sleep loss and associated sleepiness and daytime impairments in adolescence are a serious threat to the academic success, health, and safety of our nation's youth and an important public health issue. Understanding the extent and potential short- and long-term repercussions of sleep restriction, as well as the unhealthy sleep practices and environmental factors that contribute to sleep loss in adolescents, is key in setting public policies to mitigate these effects and in counseling patients and families in the clinical setting. This report reviews the current literature on sleep patterns in ado-

lescents, factors contributing to chronic sleep loss (ie, electronic media use, caffeine consumption), and health-related consequences, such as depression, increased obesity risk, and higher rates of drowsy driving accidents. The report also discusses the potential role of later school start times as a means of reducing adolescent sleepiness. (8/14)

See full text on page 713.

INSURANCE COVERAGE OF MENTAL HEALTH AND SUBSTANCE ABUSE SERVICES FOR CHILDREN AND ADOLESCENTS: A CONSENSUS STATEMENT

American Academy of Pediatrics and Others (10/00)

INTENSIVE TRAINING AND SPORTS SPECIALIZATION IN YOUNG ATHLETES

Committee on Sports Medicine and Fitness

ABSTRACT. Children involved in sports should be encouraged to participate in a variety of different activities and develop a wide range of skills. Young athletes who specialize in just one sport may be denied the benefits of varied activity while facing additional physical, physiologic, and psychologic demands from intense training and competition.

This statement reviews the potential risks of high-intensity training and sports specialization in young athletes. Pediatricians who recognize these risks can have a key role in monitoring the health of these young athletes and helping reduce risks associated with high-level sports participation. (7/00, reaffirmed 11/04, 1/06, 5/09)

INTERFERON- γ RELEASE ASSAYS FOR DIAGNOSIS OF TUBERCULOSIS INFECTION AND DISEASE IN CHILDREN (TECHNICAL REPORT)

Jeffrey R. Starke, MD, FAAP, and Committee on Infectious Diseases

ABSTRACT. Tuberculosis (TB) remains an important problem among children in the United States and throughout the world. Although diagnosis and treatment of infection with *Mycobacterium tuberculosis* (also referred to as latent tuberculosis infection [LTBI] or TB infection) remain the lynchpins of TB prevention, there is no diagnostic reference standard for LTBI. The tuberculin skin test (TST) has many limitations, including difficulty in administration and interpretation, the need for a return visit by the patient, and false-positive results caused by significant cross-reaction with *Mycobacterium bovis*-bacille Calmette-Guérin (BCG) vaccines and many nontuberculous mycobacteria. Interferon- γ release assays (IGRAs) are blood tests that measure ex vivo T-lymphocyte release of interferon- γ after stimulation by antigens specific for *M tuberculosis*. Because these antigens are not found on *M bovis*-BCG or most nontuberculous mycobacteria, IGRAs are more specific tests than the TST, yielding fewer false-positive results. However, IGRAs have little advantage over the TST in sensitivity, and both methods have reduced sensitivity in immunocompromised children, including children with severe TB disease. Both methods have a higher positive predictive value when applied to children with risk factors for LTBI. Unfortunately, neither method distinguishes between TB infection and TB disease. The objective of this technical report is to review what IGRAs are most useful for: (1) increasing test speci-

ficity in children who have received a BCG vaccine and may have a false-positive TST result; (2) using with the TST to increase sensitivity for finding LTBI in patients at high risk of developing progression from LTBI to disease; and (3) helping to diagnose TB disease. (11/14)

See full text on page 727.

INTIMATE PARTNER VIOLENCE: THE ROLE OF THE PEDIATRICIAN (CLINICAL REPORT)

Jonathan D. Thackeray, MD; Roberta Hibbard, MD; M. Denise Dowd, MD, MPH; Committee on Child Abuse and Neglect; and Committee on Injury, Violence, and Poison Prevention

ABSTRACT. The American Academy of Pediatrics and its members recognize the importance of improving the physician's ability to recognize intimate partner violence (IPV) and understand its effects on child health and development and its role in the continuum of family violence. Pediatricians are in a unique position to identify abused caregivers in pediatric settings and to evaluate and treat children raised in homes in which IPV may occur. Children exposed to IPV are at increased risk of being abused and neglected and are more likely to develop adverse health, behavioral, psychological, and social disorders later in life. Identifying IPV, therefore, may be one of the most effective means of preventing child abuse and identifying caregivers and children who may be in need of treatment and/or therapy. Pediatricians should be aware of the profound effects of exposure to IPV on children. (4/10, reaffirmed 1/14)

IODINE DEFICIENCY, POLLUTANT CHEMICALS, AND THE THYROID: NEW INFORMATION ON AN OLD PROBLEM

Council on Environmental Health

ABSTRACT. Many women of reproductive age in the United States are marginally iodine deficient, perhaps because the salt in processed foods is not iodized. Iodine deficiency, per se, can interfere with normal brain development in their offspring; in addition, it increases vulnerability to the effects of certain environmental pollutants, such as nitrate, thiocyanate, and perchlorate. Although pregnant and lactating women should take a supplement containing adequate iodide, only about 15% do so. Such supplements, however, may not contain enough iodide and may not be labeled accurately. The American Thyroid Association recommends that pregnant and lactating women take a supplement with adequate iodide. The American Academy of Pediatrics recommends that pregnant and lactating women also avoid exposure to excess nitrate, which would usually occur from contaminated well water, and thiocyanate, which is in cigarette smoke. Perchlorate is currently a candidate for regulation as a water pollutant. The Environmental Protection Agency should proceed with appropriate regulation, and the Food and Drug Administration should address the mislabeling of the iodine content of prenatal/lactation supplements. (5/14)

See full text on page 741.

LACTOSE INTOLERANCE IN INFANTS, CHILDREN, AND ADOLESCENTS (CLINICAL REPORT)

Melvin B. Heyman, MD, MPH, for Committee on Nutrition
ABSTRACT. The American Academy of Pediatrics Committee on Nutrition presents an updated review of lactose intolerance in infants, children, and adolescents. Differences between primary, secondary, congenital, and developmental lactase deficiency that may result in lactose intolerance are discussed. Children with suspected lactose intolerance can be assessed clinically by dietary lactose elimination or by tests including noninvasive hydrogen breath testing or invasive intestinal biopsy determination of lactase (and other disaccharidase) concentrations. Treatment consists of use of lactase-treated dairy products or oral lactase supplementation, limitation of lactose-containing foods, or dairy elimination. The American Academy of Pediatrics supports use of dairy foods as an important source of calcium for bone mineral health and of other nutrients that facilitate growth in children and adolescents. If dairy products are eliminated, other dietary sources of calcium or calcium supplements need to be provided. (9/06, reaffirmed 8/12)

"LATE-PRETERM" INFANTS: A POPULATION AT RISK (CLINICAL REPORT)

William A. Engle, MD; Kay M. Tomashek, MD; Carol Wallman, MSN; and Committee on Fetus and Newborn
ABSTRACT. Late-preterm infants, defined by birth at 34% through 36% weeks' gestation, are less physiologically and metabolically mature than term infants. Thus, they are at higher risk of morbidity and mortality than term infants. The purpose of this report is to define "late preterm," recommend a change in terminology from "near term" to "late preterm," present the characteristics of late-preterm infants that predispose them to a higher risk of morbidity and mortality than term infants, and propose guidelines for the evaluation and management of these infants after birth. (12/07, reaffirmed 5/10)

LAWN MOWER-RELATED INJURIES TO CHILDREN

Committee on Injury and Poison Prevention
ABSTRACT. Lawn mower-related injuries to children are relatively common and can result in severe injury or death. Many amputations during childhood are caused by power mowers. Pediatricians have an important role as advocates and educators to promote the prevention of these injuries. (6/01, reaffirmed 10/04, 5/07, 6/10)

LAWN MOWER-RELATED INJURIES TO CHILDREN (TECHNICAL REPORT)

Committee on Injury and Poison Prevention
ABSTRACT. In the United States, approximately 9400 children younger than 18 years receive emergency treatment annually for lawn mower-related injuries. More than 7% of these children require hospitalization, and power mowers cause a large proportion of the amputations during childhood. Prevention of lawn mower-related injuries can be achieved by design changes of lawn mowers, guidelines for mower operation, and education of parents, child caregivers, and children. Pediatricians have an important role as advocates and educators to promote the prevention of these injuries. (6/01, reaffirmed 10/04, 5/07, 6/10)

LEARNING DISABILITIES, DYSLEXIA, AND VISION

Section on Ophthalmology and Council on Children

With Disabilities (joint with American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists)

ABSTRACT. Learning disabilities, including reading disabilities, are commonly diagnosed in children. Their etiologies are multifactorial, reflecting genetic influences and dysfunction of brain systems. Learning disabilities are complex problems that require complex solutions. Early recognition and referral to qualified educational professionals for evidence-based evaluations and treatments seem necessary to achieve the best possible outcome. Most experts believe that dyslexia is a language-based disorder. Vision problems can interfere with the process of learning; however, vision problems are not the cause of primary dyslexia or learning disabilities. Scientific evidence does not support the efficacy of eye exercises, behavioral vision therapy, or special tinted filters or lenses for improving the long-term educational performance in these complex pediatric neurocognitive conditions. Diagnostic and treatment approaches that lack scientific evidence of efficacy, including eye exercises, behavioral vision therapy, or special tinted filters or lenses, are not endorsed and should not be recommended. (7/09, reaffirmed 7/14)

LEARNING DISABILITIES, DYSLEXIA, AND VISION (TECHNICAL REPORT)

Sheryl M. Handler, MD; Walter M. Fierson, MD; and Section on Ophthalmology and Council on Children With Disabilities (joint with American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists)

ABSTRACT. Learning disabilities constitute a diverse group of disorders in which children who generally possess at least average intelligence have problems processing information or generating output. Their etiologies are multifactorial and reflect genetic influences and dysfunction of brain systems. Reading disability, or dyslexia, is the most common learning disability. It is a receptive language-based learning disability that is characterized by difficulties with decoding, fluent word recognition, rapid automatic naming, and/or reading-comprehension skills. These difficulties typically result from a deficit in the phonologic component of language that makes it difficult to use the alphabetic code to decode the written word. Early recognition and referral to qualified professionals for evidence-based evaluations and treatments are necessary to achieve the best possible outcome. Because dyslexia is a language-based disorder, treatment should be directed at this etiology. Remedial programs should include specific instruction in decoding, fluency training, vocabulary, and comprehension. Most programs include daily intensive individualized instruction that explicitly teaches phonemic awareness and the application of phonics. Vision problems can interfere with the process of reading, but children with dyslexia or related learning disabilities have the same visual function and ocular health as children without such conditions. Currently, there is inadequate

scientific evidence to support the view that subtle eye or visual problems cause or increase the severity of learning disabilities. Because they are difficult for the public to understand and for educators to treat, learning disabilities have spawned a wide variety of scientifically unsupported vision-based diagnostic and treatment procedures. Scientific evidence does not support the claims that visual training, muscle exercises, ocular pursuit-and-tracking exercises, behavioral/perceptual vision therapy, "training" glasses, prisms, and colored lenses and filters are effective direct or indirect treatments for learning disabilities. There is no valid evidence that children who participate in vision therapy are more responsive to educational instruction than children who do not participate. (3/11)

LEGALIZATION OF MARIJUANA: POTENTIAL IMPACT ON YOUTH

Committee on Substance Abuse and Committee on Adolescence

ABSTRACT. As experts in the health care of children and adolescents, pediatricians may be called on to advise legislators concerning the potential impact of changes in the legal status of marijuana on adolescents. Parents, too, may look to pediatricians for advice as they consider whether to support state-level initiatives that propose to legalize the use of marijuana for medical purposes or to decriminalize possession of small amounts of marijuana. This policy statement provides the position of the American Academy of Pediatrics on the issue of marijuana legalization, and the accompanying technical report (available online) reviews what is currently known about the relationship between adolescents' use of marijuana and its legal status to better understand how change might influence the degree of marijuana use by adolescents in the future. (6/04)

LEGALIZATION OF MARIJUANA: POTENTIAL IMPACT ON YOUTH (TECHNICAL REPORT)

Committee on Substance Abuse and Committee on Adolescence

ABSTRACT. This technical report provides historical perspectives and comparisons of various approaches to the legal status of marijuana to aid in forming public policy. Information on the impact that decriminalization and legalization of marijuana could have on adolescents, in addition to concerns surrounding medicinal use of marijuana, are also addressed in this report. Recommendations are included in the accompanying policy statement. (6/04)

LEVELS OF NEONATAL CARE

Committee on Fetus and Newborn

ABSTRACT. Provision of risk-appropriate care for newborn infants and mothers was first proposed in 1976. This updated policy statement provides a review of data supporting evidence for a tiered provision of care and reaffirms the need for uniform, nationally applicable definitions and consistent standards of service for public health to improve neonatal outcomes. Facilities that provide hospital care for newborn infants should be classified on the basis of functional capabilities, and these facilities should be organized within a regionalized system of perinatal care. (8/12)

THE LIFELONG EFFECTS OF EARLY CHILDHOOD ADVERSITY AND TOXIC STRESS (TECHNICAL REPORT)

Jack P. Shonkoff, MD; Andrew S. Garner, MD, PhD;

Committee on Psychosocial Aspects of Child and Family Health; Committee on Early Childhood, Adoption, and Dependent Care; and Section on Developmental and Behavioral Pediatrics

ABSTRACT. Advances in fields of inquiry as diverse as neuroscience, molecular biology, genomics, developmental psychology, epidemiology, sociology, and economics are catalyzing an important paradigm shift in our understanding of health and disease across the lifespan. This converging, multidisciplinary science of human development has profound implications for our ability to enhance the life prospects of children and to strengthen the social and economic fabric of society. Drawing on these multiple streams of investigation, this report presents an ecobiodevelopmental framework that illustrates how early experiences and environmental influences can leave a lasting signature on the genetic predispositions that affect emerging brain architecture and long-term health. The report also examines extensive evidence of the disruptive impacts of toxic stress, offering intriguing insights into causal mechanisms that link early adversity to later impairments in learning, behavior, and both physical and mental well-being. The implications of this framework for the practice of medicine, in general, and pediatrics, specifically, are potentially transformational. They suggest that many adult diseases should be viewed as developmental disorders that begin early in life and that persistent health disparities associated with poverty, discrimination, or maltreatment could be reduced by the alleviation of toxic stress in childhood. An ecobiodevelopmental framework also underscores the need for new thinking about the focus and boundaries of pediatric practice. It calls for pediatricians to serve as both front-line guardians of healthy child development and strategically positioned, community leaders to inform new science-based strategies that build strong foundations for educational achievement, economic productivity, responsible citizenship, and lifelong health. (12/11)

LITERACY PROMOTION: AN ESSENTIAL COMPONENT OF PRIMARY CARE PEDIATRIC PRACTICE

Council on Early Childhood

ABSTRACT. Reading regularly with young children stimulates optimal patterns of brain development and strengthens parent-child relationships at a critical time in child development, which, in turn, builds language, literacy, and social-emotional skills that last a lifetime. Pediatric providers have a unique opportunity to encourage parents to engage in this important and enjoyable activity with their children beginning in infancy. Research has revealed that parents listen and children learn as a result of literacy promotion by pediatricians, which provides a practical and evidence-based opportunity to support early brain development in primary care practice. The American Academy of Pediatrics (AAP) recommends that pediatric providers promote early literacy development for children beginning in infancy and continuing at least until the age of kindergarten entry by (1) advising all parents that reading aloud with young children can enhance

parent-child relationships and prepare young minds to learn language and early literacy skills; (2) counseling all parents about developmentally appropriate shared-reading activities that are enjoyable for children and their parents and offer language-rich exposure to books, pictures, and the written word; (3) providing developmentally appropriate books given at health supervision visits for all high-risk, low-income young children; (4) using a robust spectrum of options to support and promote these efforts; and (5) partnering with other child advocates to influence national messaging and policies that support and promote these key early shared-reading experiences. The AAP supports federal and state funding for children's books to be provided at pediatric health supervision visits to children at high risk living at or near the poverty threshold and the integration of literacy promotion, an essential component of pediatric primary care, into pediatric resident education. This policy statement is supported by the AAP technical report "School Readiness" and supports the AAP policy statement "Early Childhood Adversity, Toxic Stress, and the Role of the Pediatrician: Translating Developmental Science Into Lifelong Health." (7/14)

LONG-TERM FOLLOW-UP CARE FOR PEDIATRIC CANCER SURVIVORS (CLINICAL REPORT)

Section on Hematology/Oncology (joint with Children's Oncology Group)

ABSTRACT. Progress in therapy has made survival into adulthood a reality for most children, adolescents, and young adults diagnosed with cancer today. Notably, this growing population remains vulnerable to a variety of long-term therapy-related sequelae. Systematic ongoing follow-up of these patients, therefore, is important for providing for early detection of and intervention for potentially serious late-onset complications. In addition, health counseling and promotion of healthy lifestyles are important aspects of long-term follow-up care to promote risk reduction for health problems that commonly present during adulthood. Both general and subspecialty pediatric health care providers are playing an increasingly important role in the ongoing care of childhood cancer survivors, beyond the routine preventive care, health supervision, and anticipatory guidance provided to all patients. This report is based on the guidelines that have been developed by the Children's Oncology Group to facilitate comprehensive long-term follow-up of childhood cancer survivors (www.survivorshipguidelines.org). (3/09, reaffirmed 4/13)

MAINTAINING AND IMPROVING THE ORAL HEALTH OF YOUNG CHILDREN

Section on Oral Health

ABSTRACT. Oral health is an integral part of the overall health of children. Dental caries is a common and chronic disease process with significant short- and long-term consequences. The prevalence of dental caries for the youngest of children has not decreased over the past decade, despite improvements for older children. As health care professionals responsible for the overall health of children, pediatricians frequently confront morbidity associated with dental caries. Because the youngest children

visit the pediatrician more often than they visit the dentist, it is important that pediatricians be knowledgeable about the disease process of dental caries, prevention of the disease, and interventions available to the pediatrician and the family to maintain and restore health. (11/14)

See full text on page 755.

MALE ADOLESCENT SEXUAL AND REPRODUCTIVE HEALTH CARE (CLINICAL REPORT)

Arik V. Marcell, MD, MPH; Charles Wibbelsman, MD;

Warren M. Seigel, MD; and Committee on Adolescence

ABSTRACT. Male adolescents' sexual and reproductive health needs often go unmet in the primary care setting. This report discusses specific issues related to male adolescents' sexual and reproductive health care in the context of primary care, including pubertal and sexual development, sexual behavior, consequences of sexual behavior, and methods of preventing sexually transmitted infections (including HIV) and pregnancy. Pediatricians are encouraged to address male adolescent sexual and reproductive health on a regular basis, including taking a sexual history, performing an appropriate examination, providing patient-centered and age-appropriate anticipatory guidance, and delivering appropriate vaccinations. Pediatricians should provide these services to male adolescent patients in a confidential and culturally appropriate manner, promote healthy sexual relationships and responsibility, and involve parents in age-appropriate discussions about sexual health with their sons. (11/11)

MALE CIRCUMCISION (TECHNICAL REPORT)

Task Force on Circumcision

ABSTRACT. Male circumcision consists of the surgical removal of some, or all, of the foreskin (or prepuce) from the penis. It is one of the most common procedures in the world. In the United States, the procedure is commonly performed during the newborn period. In 2007, the American Academy of Pediatrics (AAP) convened a multidisciplinary workgroup of AAP members and other stakeholders to evaluate the evidence regarding male circumcision and update the AAP's 1999 recommendations in this area. The Task Force included AAP representatives from specialty areas as well as members of the AAP Board of Directors and liaisons representing the American Academy of Family Physicians, the American College of Obstetricians and Gynecologists, and the Centers for Disease Control and Prevention. The Task Force members identified selected topics relevant to male circumcision and conducted a critical review of peer-reviewed literature by using the American Heart Association's template for evidence evaluation.

Evaluation of current evidence indicates that the health benefits of newborn male circumcision outweigh the risks; furthermore, the benefits of newborn male circumcision justify access to this procedure for families who choose it. Specific benefits from male circumcision were identified for the prevention of urinary tract infections, acquisition of HIV, transmission of some sexually transmitted infections, and penile cancer. Male circumcision does not appear to adversely affect penile sexual function/sensitivity or sexual satisfaction. It is imperative that those providing circumcision are adequately trained and that

both sterile techniques and effective pain management are used. Significant acute complications are rare. In general, untrained providers who perform circumcisions have more complications than well-trained providers who perform the procedure, regardless of whether the former are physicians, nurses, or traditional religious providers.

Parents are entitled to factually correct, nonbiased information about circumcision and should receive this information from clinicians before conception or early in pregnancy, which is when parents typically make circumcision decisions. Parents should determine what is in the best interest of their child. Physicians who counsel families about this decision should provide assistance by explaining the potential benefits and risks and ensuring that parents understand that circumcision is an elective procedure. The Task Force strongly recommends the creation, revision, and enhancement of educational materials to assist parents of male infants with the care of circumcised and uncircumcised penises. The Task Force also strongly recommends the development of educational materials for providers to enhance practitioners' competency in discussing circumcision's benefits and risks with parents.

The Task Force made the following recommendations:

- Evaluation of current evidence indicates that the health benefits of newborn male circumcision outweigh the risks, and the benefits of newborn male circumcision justify access to this procedure for those families who choose it.
 - Parents are entitled to factually correct, nonbiased information about circumcision that should be provided before conception and early in pregnancy, when parents are most likely to be weighing the option of circumcision of a male child.
 - Physicians counseling families about elective male circumcision should assist parents by explaining, in a nonbiased manner, the potential benefits and risks and by ensuring that they understand the elective nature of the procedure.
 - Parents should weigh the health benefits and risks in light of their own religious, cultural, and personal preferences, as the medical benefits alone may not outweigh these other considerations for individual families.
 - Parents of newborn boys should be instructed in the care of the penis, regardless of whether the newborn has been circumcised or not.
 - Elective circumcision should be performed only if the infant's condition is stable and healthy.
 - Male circumcision should be performed by trained and competent practitioners, by using sterile techniques and effective pain management.
 - Analgesia is safe and effective in reducing the procedural pain associated with newborn circumcision; thus, adequate analgesia should be provided whenever newborn circumcision is performed.
- Nonpharmacologic techniques (eg, positioning, sucrose pacifiers) alone are insufficient to prevent procedural and postprocedural pain and are not recommended as the sole method of analgesia. They

should be used only as analgesic adjuncts to improve infant comfort during circumcision.

- If used, topical creams may cause a higher incidence of skin irritation in low birth weight infants, compared with infants of normal weight; penile nerve block techniques should therefore be chosen for this group of newborns.
 - Key professional organizations (AAP, the American Academy of Family Physicians, the American College of Obstetricians and Gynecologists, the American Society of Anesthesiologists, the American College of Nurse-Midwives, and other midlevel clinicians such as nurse practitioners) should work collaboratively to:
 - Develop standards of trainee proficiency in the performance of anesthetic and procedure techniques, including suturing;
 - Teach the procedure and analgesic techniques during postgraduate training programs;
 - Develop educational materials for clinicians to enhance their own competency in discussing the benefits and risks of circumcision with parents;
 - Offer educational materials to assist parents of male infants with the care of both circumcised and uncircumcised penises.
 - The preventive and public health benefits associated with newborn male circumcision warrant third-party reimbursement of the procedure.
- The American College of Obstetricians and Gynecologists has endorsed this technical report. (8/12)

MALTREATMENT OF CHILDREN WITH DISABILITIES (CLINICAL REPORT)

Roberta A. Hibbard, MD; Larry W. Desch, MD; Committee on Child Abuse and Neglect; and Council on Children With Disabilities

ABSTRACT. Widespread efforts are being made to increase awareness and provide education to pediatricians regarding risk factors of child abuse and neglect. The purpose of this clinical report is to ensure that children with disabilities are recognized as a population that is also at risk of maltreatment. Some conditions related to a disability can be confused with maltreatment. The need for early recognition and intervention of child abuse and neglect in this population, as well as the ways that a medical home can facilitate the prevention and early detection of child maltreatment, are the subject of this report. (5/07, reaffirmed 1/11)

MANAGEMENT OF CHILDREN WITH AUTISM SPECTRUM DISORDERS (CLINICAL REPORT)

Scott M. Myers, MD; Chris Plauché Johnson, MD, MEd; and Council on Children With Disabilities

ABSTRACT. Pediatricians have an important role not only in early recognition and evaluation of autism spectrum disorders but also in chronic management of these disorders. The primary goals of treatment are to maximize the child's ultimate functional independence and quality of life by minimizing the core autism spectrum disorder features, facilitating development and learning, promot-

ing socialization, reducing maladaptive behaviors, and educating and supporting families. To assist pediatricians in educating families and guiding them toward empirically supported interventions for their children, this report reviews the educational strategies and associated therapies that are the primary treatments for children with autism spectrum disorders. Optimization of health care is likely to have a positive effect on habilitative progress, functional outcome, and quality of life; therefore, important issues, such as management of associated medical problems, pharmacologic and nonpharmacologic intervention for challenging behaviors or coexisting mental health conditions, and use of complementary and alternative medical treatments, are also addressed. (11/07, reaffirmed 9/10, 8/14)

MANAGEMENT OF DENTAL TRAUMA IN A PRIMARY CARE SETTING (CLINICAL REPORT)

Martha Ann Keels, DDS, PhD, and Section on Oral Health

ABSTRACT. The American Academy of Pediatrics and its Section on Oral Health have developed this clinical report for pediatricians and primary care physicians regarding the diagnosis, evaluation, and management of dental trauma in children aged 1 to 21 years. This report was developed through a comprehensive search and analysis of the medical and dental literature and expert consensus. Guidelines published and updated by the International Association of Dental Traumatology (www.dentaltrauma-guide.com) are an excellent resource for both dental and nondental health care providers. (1/14)

See full text on page 763.

MANAGEMENT OF FOOD ALLERGY IN THE SCHOOL SETTING (CLINICAL REPORT)

Scott H. Sicherer, MD; Todd Mahr, MD; and Section on Allergy and Immunology

ABSTRACT. Food allergy is estimated to affect approximately 1 in 25 school-aged children and is the most common trigger of anaphylaxis in this age group. School food-allergy management requires strategies to reduce the risk of ingestion of the allergen as well as procedures to recognize and treat allergic reactions and anaphylaxis. The role of the pediatrician or pediatric health care provider may include diagnosing and documenting a potentially life-threatening food allergy, prescribing self-injectable epinephrine, helping the child learn how to store and use the medication in a responsible manner, educating the parents of their responsibility to implement prevention strategies within and outside the home environment, and working with families, schools, and students in developing written plans to reduce the risk of anaphylaxis and to implement emergency treatment in the event of a reaction. This clinical report highlights the role of the pediatrician and pediatric health care provider in managing students with food allergies. (11/10)

MANAGEMENT OF NEONATES WITH SUSPECTED OR PROVEN EARLY-ONSET BACTERIAL SEPSIS (CLINICAL REPORT)

Richard A. Polin, MD, and Committee on Fetus and Newborn

ABSTRACT. With improved obstetrical management and evidence-based use of intrapartum antimicrobial therapy, early-onset neonatal sepsis is becoming less frequent.

However, early-onset sepsis remains one of the most common causes of neonatal morbidity and mortality in the preterm population. The identification of neonates at risk for early-onset sepsis is frequently based on a constellation of perinatal risk factors that are neither sensitive nor specific. Furthermore, diagnostic tests for neonatal sepsis have a poor positive predictive accuracy. As a result, clinicians often treat well-appearing infants for extended periods of time, even when bacterial cultures are negative. The optimal treatment of infants with suspected early-onset sepsis is broad-spectrum antimicrobial agents (ampicillin and an aminoglycoside). Once a pathogen is identified, antimicrobial therapy should be narrowed (unless synergism is needed). Recent data suggest an association between prolonged empirical treatment of preterm infants (≥ 5 days) with broad-spectrum antibiotics and higher risks of late onset sepsis, necrotizing enterocolitis, and mortality. To reduce these risks, antimicrobial therapy should be discontinued at 48 hours in clinical situations in which the probability of sepsis is low. The purpose of this clinical report is to provide a practical and, when possible, evidence-based approach to the management of infants with suspected or proven early-onset sepsis. (4/12)

MANAGEMENT OF PEDIATRIC TRAUMA

Section on Orthopaedics, Committee on Pediatric Emergency Medicine, Section on Critical Care, Section on Surgery, and Section on Transport Medicine (joint with Pediatric Orthopaedic Society of North America)

ABSTRACT. Injury is the number 1 killer of children in the United States. In 2004, injury accounted for 59.5% of all deaths in children younger than 18 years. The financial burden to society of children who survive childhood injury with disability continues to be enormous. The entire process of managing childhood injury is complex and varies by region. Only the comprehensive cooperation of a broadly diverse group of people will have a significant effect on improving the care and outcome of injured children. (4/08, reaffirmed 4/13)

MANAGEMENT OF TYPE 2 DIABETES MELLITUS IN CHILDREN AND

ADOLESCENTS (TECHNICAL REPORT)

Shelley C. Springer, MD, MBA, MSc, JD; Janet Silverstein, MD; Kenneth Copeland, MD; Kelly R. Moore, MD; Greg E. Prazar, MD; Terry Raymer, MD, CDE; Richard N. Shiffman, MD; Vidhu V. Thaker, MD; Meaghan Anderson, MS, RD, LD, CDE; Stephen J. Spann, MD, MBA; and Susan K. Flinn, MA

ABSTRACT. Objective. Over the last 3 decades, the prevalence of childhood obesity has increased dramatically in North America, ushering in a variety of health problems, including type 2 diabetes mellitus (T2DM), which previously was not typically seen until much later in life. This technical report describes, in detail, the procedures undertaken to develop the recommendations given in the accompanying clinical practice guideline, "Management of Type 2 Diabetes Mellitus in Children and Adolescents," and provides in-depth information about the rationale for the recommendations and the studies used to make the clinical practice guideline's recommendations.

Methods. A primary literature search was conducted relating to the treatment of T2DM in children and adolescents, and a secondary literature search was conducted relating to the screening and treatment of T2DM's comorbidities in children and adolescents. Inclusion criteria were prospectively and unanimously agreed on by members of the committee. An article was eligible for inclusion if it addressed treatment (primary search) or 1 of 4 comorbidities (secondary search) of T2DM, was published in 1990 or later, was written in English, and included an abstract. Only primary research inquiries were considered; review articles were considered if they included primary data or opinion. The research population had to constitute children and/or adolescents with an existing diagnosis of T2DM; studies of adult patients were considered if at least 10% of the study population was younger than 35 years. All retrieved titles, abstracts, and articles were reviewed by the consulting epidemiologist.

Results. Thousands of articles were retrieved and considered in both searches on the basis of the aforementioned criteria. From those, in the primary search, 199 abstracts were identified for possible inclusion, 58 of which were retained for systematic review. Five of these studies were classified as grade A studies, 1 as grade B, 20 as grade C, and 32 as grade D. Articles regarding treatment of T2DM selected for inclusion were divided into 4 major subcategories on the basis of type of treatment being discussed: (1) medical treatments (32 studies); (2) nonmedical treatments (9 studies); (3) provider behaviors (8 studies); and (4) social issues (9 studies). From the secondary search, an additional 336 abstracts relating to comorbidities were identified for possible inclusion, of which 26 were retained for systematic review. These articles included the following: 1 systematic review of literature regarding comorbidities of T2DM in adolescents; 5 expert opinions presenting global recommendations not based on evidence; 5 cohort studies reporting natural history of disease and comorbidities; 3 with specific attention to comorbidity patterns in specific ethnic groups (case-control, cohort, and clinical report using adult literature); 3 reporting an association between microalbuminuria and retinopathy (2 case-control, 1 cohort); 3 reporting the prevalence of nephropathy (cohort); 1 reporting peripheral vascular disease (case series); 2 discussing retinopathy (1 case-control, 1 position statement); and 3 addressing hyperlipidemia (American Heart Association position statement on cardiovascular risks; American Diabetes Association consensus statement; case series). A breakdown of grade of recommendation shows no grade A studies, 10 grade B studies, 6 grade C studies, and 10 grade D studies. With regard to screening and treatment recommendations for comorbidities, data in children are scarce, and the available literature is conflicting. Therapeutic recommendations for hypertension, dyslipidemia, retinopathy, microalbuminuria, and depression were summarized from expert guideline documents and are presented in detail in the guideline. The references are provided, but the committee did not independently assess the supporting evidence. Screening tools are provided in the Supplemental Information. (1/13)

MARIJUANA: A CONTINUING CONCERN FOR PEDIATRICIANS

Committee on Substance Abuse

ABSTRACT. Marijuana, the common name for products derived from the plant *Cannabis sativa*, is the most common illicit drug used by children and adolescents in the United States. Despite growing concerns by the medical profession about the physical and psychological effects of its active ingredient, Δ -9-tetrahydrocannabinol, survey data continue to show that increasing numbers of young people are using the drug as they become less concerned about its dangers. (10/99, reaffirmed 4/03)

MATERNAL PHENYLKETONURIA

Committee on Genetics

ABSTRACT. Elevated maternal phenylalanine concentrations during pregnancy are teratogenic and may result in growth retardation, microcephaly, significant developmental delays, and birth defects in the offspring of women with poorly controlled phenylketonuria during pregnancy. Women of childbearing age with all forms of phenylketonuria, including mild variants such as mild hyperphenylalaninemia, should receive counseling concerning their risks for adverse fetal effects, optimally before conceiving. The best outcomes occur when strict control of maternal phenylalanine concentration is achieved before conception and continued throughout pregnancy. Included are brief descriptions of novel treatments for phenylketonuria. (8/08, reaffirmed 1/13)

MATERNAL-FETAL INTERVENTION AND FETAL CARE CENTERS (CLINICAL REPORT)

Committee on Bioethics (joint with American College of Obstetricians and Gynecologists Committee on Ethics)

ABSTRACT. The past 2 decades have yielded profound advances in the fields of prenatal diagnosis and fetal intervention. Although fetal interventions are driven by a beneficence-based motivation to improve fetal and neonatal outcomes, advancement in fetal therapies raises ethical issues surrounding maternal autonomy and decision-making, concepts of innovation versus research, and organizational aspects within institutions in the development of fetal care centers. To safeguard the interests of both the pregnant woman and the fetus, the American College of Obstetricians and Gynecologists and the American Academy of Pediatrics make recommendations regarding informed consent, the role of research subject advocates and other independent advocates, the availability of support services, the multidisciplinary nature of fetal intervention teams, the oversight of centers, and the need to accumulate maternal and fetal outcome data. (7/11)

MEDIA EDUCATION

Committee on Communications and Media

ABSTRACT. The American Academy of Pediatrics recognizes that exposure to mass media (eg, television, movies, video and computer games, the Internet, music lyrics and videos, newspapers, magazines, books, advertising) presents health risks for children and adolescents but can provide benefits as well. Media education has the potential to reduce the harmful effects of media and accentuate

the positive effects. By understanding and supporting media education, pediatricians can play an important role in reducing harmful effects of media on children and adolescents. (9/10)

MEDIA USE BY CHILDREN YOUNGER THAN 2 YEARS

Council on Communications and Media

ABSTRACT. In 1999, the American Academy of Pediatrics (AAP) issued a policy statement addressing media use in children. The purpose of that statement was to educate parents about the effects that media—both the amount and the content—may have on children. In one part of that statement, the AAP recommended that “pediatricians should urge parents to avoid television viewing for children under the age of two years.” The wording of the policy specifically discouraged media use in this age group, although it is frequently misquoted by media outlets as no media exposure in this age group. The AAP believed that there were significantly more potential negative effects of media than positive ones for this age group and, thus, advised families to thoughtfully consider media use for infants. This policy statement reaffirms the 1999 statement with respect to media use in infants and children younger than 2 years and provides updated research findings to support it. This statement addresses (1) the lack of evidence supporting educational or developmental benefits for media use by children younger than 2 years, (2) the potential adverse health and developmental effects of media use by children younger than 2 years, and (3) diverse effects of parental media use (background media) on children younger than 2 years. (10/11)

MEDIA VIOLENCE

Council on Communications and Media

ABSTRACT. Exposure to violence in media, including television, movies, music, and video games, represents a significant risk to the health of children and adolescents. Extensive research evidence indicates that media violence can contribute to aggressive behavior, desensitization to violence, nightmares, and fear of being harmed. Pediatricians should assess their patients’ level of media exposure and intervene on media-related health risks. Pediatricians and other child health care providers can advocate for a safer media environment for children by encouraging media literacy, more thoughtful and proactive use of media by children and their parents, more responsible portrayal of violence by media producers, and more useful and effective media ratings. Office counseling has been shown to be effective. (10/09)

MEDICAID POLICY STATEMENT

Committee on Child Health Financing

ABSTRACT. Medicaid insures 39% of the children in the United States. This revision of the 2005 Medicaid Policy Statement of the American Academy of Pediatrics reflects opportunities for changes in state Medicaid programs resulting from the 2010 Patient Protection and Affordable Care Act as upheld in 2012 by the Supreme Court. Policy recommendations focus on the areas of benefit coverage, financing and payment, eligibility, outreach and enrollment, managed care, and quality improvement. (4/13)

MEDICAL CONCERNS IN THE FEMALE ATHLETE*Committee on Sports Medicine and Fitness*

ABSTRACT. Female children and adolescents who participate regularly in sports may develop certain medical conditions, including disordered eating, menstrual dysfunction, and decreased bone mineral density. The pediatrician can play an important role in monitoring the health of young female athletes. This revised policy statement provides updated and expanded information for pediatricians on these health concerns as well as recommendations for evaluation, treatment, and ongoing assessments of female athletes. (9/00, reaffirmed 5/05, 5/08)

MEDICAL CONDITIONS AFFECTING SPORTS PARTICIPATION (CLINICAL REPORT)*Stephen G. Rice, MD, PhD, MPH, and Council on Sports Medicine and Fitness*

ABSTRACT. Children and adolescents with medical conditions present special issues with respect to participation in athletic activities. The pediatrician can play an important role in determining whether a child with a health condition should participate in certain sports by assessing the child's health status, suggesting appropriate equipment or modifications of sports to decrease the risk of injury, and educating the athlete, parent(s) or guardian, and coach regarding the risks of injury as they relate to the child's condition. This report updates a previous policy statement and provides information for pediatricians on sports participation for children and adolescents with medical conditions. (4/08, reaffirmed 5/11, 6/14)

MEDICAL EMERGENCIES OCCURRING AT SCHOOL*Council on School Health*

ABSTRACT. Children and adults might experience medical emergency situations because of injuries, complications of chronic health conditions, or unexpected major illnesses that occur in schools. In February 2001, the American Academy of Pediatrics issued a policy statement titled "Guidelines for Emergency Medical Care in Schools" (available at: <http://aappolicy.aappublications.org/cgi/content/full/pediatrics;107/2/435>). Since the release of that statement, the spectrum of potential individual student emergencies has changed significantly. The increase in the number of children with special health care needs and chronic medical conditions attending schools and the challenges associated with ensuring that schools have access to on-site licensed health care professionals on an ongoing basis have added to increasing the risks of medical emergencies in schools. The goal of this statement is to increase pediatricians' awareness of schools' roles in preparing for individual student emergencies and to provide recommendations for primary care and school physicians on how to assist and support school personnel. (10/08, reaffirmed 9/11)

THE MEDICAL HOME*Medical Home Initiatives for Children With Special Needs Project Advisory Committee (7/02, reaffirmed 5/08)***MEDICAL STAFF APPOINTMENT AND DELINEATION OF PEDIATRIC PRIVILEGES IN HOSPITALS (CLINICAL REPORT)***Daniel A. Rauch, MD; Committee on Hospital Care; and Section on Hospital Medicine*

ABSTRACT. The review and verification of credentials and the granting of clinical privileges are required of every hospital to ensure that members of the medical staff are competent and qualified to provide specified levels of patient care. The credentialing process involves the following: (1) assessment of the professional and personal background of each practitioner seeking privileges; (2) assignment of privileges appropriate for the clinician's training and experience; (3) ongoing monitoring of the professional activities of each staff member; and (4) periodic reappointment to the medical staff on the basis of objectively measured performance. We examine the essential elements of a credentials review for initial and renewed medical staff appointments along with suggested criteria for the delineation of clinical privileges. Sample forms for the delineation of privileges can be found on the American Academy of Pediatrics Committee on Hospital Care Web site (<http://www.aap.org/visit/cmt19.htm>). Because of differences among individual hospitals, no 1 method for credentialing is universally applicable. The medical staff of each hospital must, therefore, establish its own process based on the general principles reviewed in this report. The issues of medical staff membership and credentialing have become very complex, and institutions and medical staffs are vulnerable to legal action. Consequently, it is advisable for hospitals and medical staffs to obtain expert legal advice when medical staff bylaws are constructed or revised. (3/12)

MENINGOCOCCAL CONJUGATE VACCINES POLICY UPDATE: BOOSTER DOSE RECOMMENDATIONS*Committee on Infectious Diseases*

ABSTRACT. The Advisory Committee on Immunization Practices of the Centers for Disease Control and Prevention and the American Academy of Pediatrics approved updated recommendations for the use of quadravalent (serogroups A, C, W-135, and Y) meningococcal conjugate vaccines (Menactra [Sanofi Pasteur, Swiftwater, PA] and Menveo [Novartis, Basel, Switzerland]) in adolescents and in people at persistent high risk of meningococcal disease. The recommendations supplement previous Advisory Committee on Immunization Practices and American Academy of Pediatrics recommendations for meningococcal vaccinations. Data were reviewed pertaining to immunogenicity in high-risk groups, bactericidal antibody persistence after immunization, current epidemiology of meningococcal disease, meningococcal conjugate vaccine effectiveness, and cost-effectiveness of different strategies for vaccination of adolescents. This review prompted the following recommendations: (1) adolescents should be routinely immunized at 11 through 12 years of age and given a booster dose at 16 years of age; (2) adolescents who received their first dose at age 13 through 15 years should receive a booster at age 16 through 18 years or up to 5 years after their first dose; (3) adolescents who receive their first dose of meningococcal conjugate vaccine at or after 16 years of age do not need a booster dose; (4) a 2-dose

primary series should be administered 2 months apart for those who are at increased risk of invasive meningococcal disease because of persistent complement component (eg, C5–C9, properdin, factor H, or factor D) deficiency (9 months through 54 years of age) or functional or anatomic asplenia (2–54 years of age) and for adolescents with HIV infection; and (5) a booster dose should be given 3 years after the primary series if the primary 2-dose series was given from 2 through 6 years of age and every 5 years for persons whose 2-dose primary series or booster dose was given at 7 years of age or older who are at risk of invasive meningococcal disease because of persistent component (eg, C5–C9, properdin, factor H, or factor D) deficiency or functional or anatomic asplenia. (11/11)

MENSTRUATION IN GIRLS AND ADOLESCENTS: USING THE MENSTRUAL CYCLE AS A VITAL SIGN (CLINICAL REPORT)

Committee on Adolescence (joint with American College of Obstetricians and Gynecologists Committee on Adolescent Health Care)

ABSTRACT. Young patients and their parents often are unsure about what represents normal menstrual patterns, and clinicians also may be unsure about normal ranges for menstrual cycle length and amount and duration of flow through adolescence. It is important to be able to educate young patients and their parents regarding what to expect of a first period and about the range for normal cycle length of subsequent menses. It is equally important for clinicians to have an understanding of bleeding patterns in girls and adolescents, the ability to differentiate between normal and abnormal menstruation, and the skill to know how to evaluate young patients' conditions appropriately. Using the menstrual cycle as an additional vital sign adds a powerful tool to the assessment of normal development and the exclusion of pathological conditions. (11/06)

MINORS AS LIVING SOLID-ORGAN DONORS (CLINICAL REPORT)

Lainie Friedman Ross, MD, PhD; J. Richard Thistlethwaite Jr, MD, PhD; and Committee on Bioethics

ABSTRACT. In the past half-century, solid-organ transplantation has become standard treatment for a variety of diseases in children and adults. The major limitation for all transplantation is the availability of donors, and the gap between demand and supply continues to grow despite the increase in living donors. Although rare, children do serve as living donors, and these donations raise serious ethical issues. This clinical report includes a discussion of the ethical considerations regarding minors serving as living donors, using the traditional benefit/burden calculus from the perspectives of both the donor and the recipient. The report also includes an examination of the circumstances under which a minor may morally participate as a living donor, how to minimize risks, and what the informed-consent process should entail. The American Academy of Pediatrics holds that minors can morally serve as living organ donors but only in exceptional circumstances when specific criteria are fulfilled. (8/08, reaffirmed 5/11)

MODEL CONTRACTUAL LANGUAGE FOR MEDICAL NECESSITY FOR CHILDREN

Committee on Child Health Financing

ABSTRACT. The term "medical necessity" is used by Medicare and Medicaid and in insurance contracts to refer to medical services that are generally recognized as appropriate for the diagnosis, prevention, or treatment of disease and injury. There is no consensus on how to define and apply the term and the accompanying rules and regulations, and as a result there has been substantial variation in medical-necessity definitions and interpretations. With this policy statement, the American Academy of Pediatrics hopes to encourage insurers to adopt more consistent medical-necessity definitions that take into account the needs of children. (7/05, reaffirmed 10/11)

MOLECULAR GENETIC TESTING IN PEDIATRIC PRACTICE: A SUBJECT REVIEW (CLINICAL REPORT)

Committee on Genetics

ABSTRACT. Although many types of diagnostic and carrier testing for genetic disorders have been available for decades, the use of molecular methods is a relatively recent phenomenon. Such testing has expanded the range of disorders that can be diagnosed and has enhanced the ability of clinicians to provide accurate prognostic information and institute appropriate health supervision measures. However, the proper application of these tests may be difficult because of their scientific complexity and the potential for negative, sometimes unexpected, consequences for many patients. The purposes of this subject review are to provide background information on molecular genetic tests, to describe specific testing modalities, and to discuss some of the benefits and risks specific to the pediatric population. It is likely that pediatricians will use these testing methods increasingly for their patients and will need to evaluate critically their diagnostic and prognostic implications. (12/00, reaffirmed 5/07)

MOTOR DELAYS: EARLY IDENTIFICATION AND EVALUATION (CLINICAL REPORT)

Garey H. Noritz, MD; Nancy A. Murphy, MD; and Neuromotor Screening Expert Panel

ABSTRACT. Pediatricians often encounter children with delays of motor development in their clinical practices. Earlier identification of motor delays allows for timely referral for developmental interventions as well as diagnostic evaluations and treatment planning. A multidisciplinary expert panel developed an algorithm for the surveillance and screening of children for motor delays within the medical home, offering guidance for the initial workup and referral of the child with possible delays in motor development. Highlights of this clinical report include suggestions for formal developmental screening at the 9-, 18-, 30-, and 48-month well-child visits; approaches to the neurologic examination, with emphasis on the assessment of muscle tone; and initial diagnostic approaches for medical home providers. Use of diagnostic tests to evaluate children with motor delays are described, including brain MRI for children with high muscle tone, and measuring serum creatine kinase concentration of those with decreased muscle tone. The importance of

pursuing diagnostic tests while concurrently referring patients to early intervention programs is emphasized. (5/13)

NEONATAL DRUG WITHDRAWAL (CLINICAL REPORT)

Mark L. Hudak, MD; Rosemarie C. Tan, MD, PhD;

Committee on Drugs; and Committee on Fetus and Newborn

ABSTRACT. Maternal use of certain drugs during pregnancy can result in transient neonatal signs consistent with withdrawal or acute toxicity or cause sustained signs consistent with a lasting drug effect. In addition, hospitalized infants who are treated with opioids or benzodiazepines to provide analgesia or sedation may be at risk for manifesting signs of withdrawal. This statement updates information about the clinical presentation of infants exposed to intrauterine drugs and the therapeutic options for treatment of withdrawal and is expanded to include evidence-based approaches to the management of the hospitalized infant who requires weaning from analgesics or sedatives. (1/12)

THE NEW MORBIDITY REVISITED: A RENEWED COMMITMENT TO THE PSYCHOSOCIAL ASPECTS OF PEDIATRIC CARE

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. In 1993, the American Academy of Pediatrics adopted the policy statement "The Pediatrician and the 'New Morbidity.'" Since then, social difficulties, behavioral problems, and developmental difficulties have become a main part of the scope of pediatric practice, and recognition of the importance of these areas has increased. This statement reaffirms the Academy's commitment to prevention, early detection, and management of behavioral, developmental, and social problems as a focus in pediatric practice. (11/01)

NEWBORN SCREENING EXPANDS: RECOMMENDATIONS FOR PEDIATRICIANS AND MEDICAL HOMES—IMPLICATIONS FOR THE SYSTEM (CLINICAL REPORT)

Newborn Screening Authoring Committee

ABSTRACT. Advances in newborn screening technology, coupled with recent advances in the diagnosis and treatment of rare but serious congenital conditions that affect newborn infants, provide increased opportunities for positively affecting the lives of children and their families. These advantages also pose new challenges to primary care pediatricians, both educationally and in response to the management of affected infants. Primary care pediatricians require immediate access to clinical and diagnostic information and guidance and have a proactive role to play in supporting the performance of the newborn screening system. Primary care pediatricians must develop office policies and procedures to ensure that newborn screening is conducted and that results are transmitted to them in a timely fashion; they must also develop strategies to use should these systems fail. In addition, collaboration with local, state, and national partners is essential for promoting actions and policies that will optimize the function of

the newborn screening systems and ensure that families receive the full benefit of them. (1/08)

NEWBORN SCREENING FACT SHEETS, INTRODUCTION TO THE (TECHNICAL REPORT)

Celia I. Kaye, MD, PhD, and Committee on Genetics

ABSTRACT. Newborn screening fact sheets were last revised in 1996 by the Committee on Genetics of the American Academy of Pediatrics. These fact sheets have been revised again because of advances in the field, including technologic innovations such as tandem mass spectrometry, as well as greater appreciation of ethical issues such as informed consent. The fact sheets provide information to assist pediatricians and other professionals who care for children in performing their essential role within the newborn screening public health system. The newborn screening system consists of 5 parts: (1) newborn testing; (2) follow-up of abnormal screening results to facilitate timely diagnostic testing and management; (3) diagnostic testing; (4) disease management, which requires coordination with the medical home and genetic counseling; and (5) continuous evaluation and improvement of the newborn screening system. The following disorders are reviewed in the newborn screening fact sheets (which are available at www.pediatrics.org/cgi/content/full/118/3/e934): biotinidase deficiency, congenital adrenal hyperplasia, congenital hearing loss, congenital hypothyroidism, cystic fibrosis, galactosemia, homocystinuria, maple syrup urine disease, medium-chain acyl-coenzyme A dehydrogenase deficiency, phenylketonuria, sickle cell disease and other hemoglobinopathies, and tyrosinemia. (9/06, reaffirmed 1/11)

NEWBORN SCREENING FACT SHEETS (TECHNICAL REPORT)

Celia I. Kaye, MD, PhD, and Committee on Genetics

ABSTRACT. Newborn screening fact sheets were last revised in 1996 by the American Academy of Pediatrics Committee on Genetics. This revision was prompted by advances in the field since 1996, including technologic innovations, as well as greater appreciation of ethical issues such as those surrounding informed consent. The following disorders are discussed in this revision of the newborn screening fact sheets: biotinidase deficiency, congenital adrenal hyperplasia, congenital hearing loss, congenital hypothyroidism, cystic fibrosis, galactosemia, homocystinuria, maple syrup urine disease, medium-chain acyl-coenzyme A dehydrogenase deficiency, phenylketonuria, sickle cell disease and other hemoglobinopathies, and tyrosinemia. A series of topics related to newborn screening is discussed in a companion publication to this electronic publication of the fact sheets (available at: www.pediatrics.org/cgi/content/full/118/3/1304). These topics are newborn screening as a public health system; factors contributing to the need for review of the newborn screening system; informed consent; tandem mass spectrometry; DNA analysis in newborn screening; status of newborn screening in the United States; and the effect of sample timing, preterm birth, diet, transfusion, and total parenteral nutrition on newborn screening results. (9/06, reaffirmed 1/11)

NONDISCRIMINATION IN PEDIATRIC HEALTH CARE

Committee on Pediatric Workforce

ABSTRACT. This policy statement is a revision of a 2001 statement and articulates the positions of the American Academy of Pediatrics on nondiscrimination in pediatric health care. It addresses both pediatricians who provide health care and the infants, children, adolescents, and young adults whom they serve. (10/07, reaffirmed 6/11)

NONINITIATION OR WITHDRAWAL OF INTENSIVE CARE FOR HIGH-RISK NEWBORNS

Committee on Fetus and Newborn

ABSTRACT. Advances in medical technology have led to dilemmas in initiation and withdrawal of intensive care of newborn infants with a very poor prognosis. Physicians and parents together must make difficult decisions guided by their understanding of the child's best interest. The foundation for these decisions consists of several key elements: (1) direct and open communication between the health care team and the parents of the child with regard to the medical status, prognosis, and treatment options; (2) inclusion of the parents as active participants in the decision process; (3) continuation of comfort care even when intensive care is not being provided; and (4) treatment decisions that are guided primarily by the best interest of the child. (2/07, reaffirmed 5/10)

NONORAL FEEDING FOR CHILDREN AND YOUTH WITH DEVELOPMENTAL OR ACQUIRED DISABILITIES (CLINICAL REPORT)

Richard C. Adams, MD, FAAP; Ellen Roy Elias, MD, FAAP; and Council on Children With Disabilities

ABSTRACT. The decision to initiate enteral feedings is multifaceted, involving medical, financial, cultural, and emotional considerations. Children who have developmental or acquired disabilities are at risk for having primary and secondary conditions that affect growth and nutritional well-being. This clinical report provides (1) an overview of clinical issues in children who have developmental or acquired disabilities that may prompt a need to consider nonoral feedings, (2) a systematic way to support the child and family in clinical decisions related to initiating nonoral feeding, (3) information on surgical options that the family may need to consider in that decision-making process, and (4) pediatric guidance for ongoing care after initiation of nonoral feeding intervention, including care of the gastrostomy tube and skin site. Ongoing medical and psychosocial support is needed after initiation of nonoral feedings and is best provided through the collaborative efforts of the family and a team of professionals that may include the pediatrician, dietitian, social worker, and/or therapists. (11/14)

See full text on page 777.

NONTHERAPEUTIC USE OF ANTIMICROBIAL AGENTS IN ANIMAL AGRICULTURE: IMPLICATIONS FOR PEDIATRICS (TECHNICAL REPORT)

Committee on Environmental Health and Committee on Infectious Diseases

ABSTRACT. Antimicrobial resistance is widespread. Overuse or misuse of antimicrobial agents in veterinary and human medicine is responsible for increasing the crisis of resistance to antimicrobial agents. The American

Academy of Pediatrics, in conjunction with the US Public Health Service, has begun to address this problem by disseminating policies on the judicious use of antimicrobial agents in humans. Between 40% and 80% of the antimicrobial agents used in the United States each year are used in food animals; many are identical or very similar to drugs used in humans. Most of this use involves the addition of low doses of antimicrobial agents to the feed of healthy animals over prolonged periods to promote growth and increase feed efficiency or at a range of doses to prevent disease. These nontherapeutic uses contribute to resistance and create health dangers for humans. This report will describe how antimicrobial agents are used in animal agriculture and review the mechanisms by which such uses contribute to resistance in human pathogens. Although therapeutic use of antimicrobial agents in agriculture clearly contributes to the development of resistance, this report will concentrate on nontherapeutic uses in healthy animals. (9/04, reaffirmed 10/08, 4/13)

OFFICE-BASED CARE FOR LESBIAN, GAY, BISEXUAL, TRANSGENDER, AND QUESTIONING YOUTH

Committee on Adolescence

ABSTRACT. The American Academy of Pediatrics issued its last statement on homosexuality and adolescents in 2004. Although most lesbian, gay, bisexual, transgender, and questioning (LGBTQ) youth are quite resilient and emerge from adolescence as healthy adults, the effects of homophobia and heterosexism can contribute to health disparities in mental health with higher rates of depression and suicidal ideation, higher rates of substance abuse, and more sexually transmitted and HIV infections. Pediatricians should have offices that are teen-friendly and welcoming to sexual minority youth. Obtaining a comprehensive, confidential, developmentally appropriate adolescent psychosocial history allows for the discovery of strengths and assets as well as risks. Referrals for mental health or substance abuse may be warranted. Sexually active LGBTQ youth should have sexually transmitted infection/HIV testing according to recommendations of the Sexually Transmitted Diseases Treatment Guidelines of the Centers for Disease Control and Prevention based on sexual behaviors. With appropriate assistance and care, sexual minority youth should live healthy, productive lives while transitioning through adolescence and young adulthood. (6/13)

OFFICE-BASED CARE FOR LESBIAN, GAY, BISEXUAL, TRANSGENDER, AND QUESTIONING YOUTH (TECHNICAL REPORT)

David A. Levine, MD, and Committee on Adolescence

ABSTRACT. The American Academy of Pediatrics issued its last statement on homosexuality and adolescents in 2004. This technical report reflects the rapidly expanding medical and psychosocial literature about sexual minority youth. Pediatricians should be aware that some youth in their care may have concerns or questions about their sexual orientation or that of siblings, friends, parents, relatives, or others and should provide factual, current, nonjudgmental information in a confidential manner. Although most lesbian, gay, bisexual, transgender, and questioning (LGBTQ) youth are quite resilient and

emerge from adolescence as healthy adults, the effects of homophobia and heterosexism can contribute to increased mental health issues for sexual minority youth. LGBTQ and MSM/WSW (men having sex with men and women having sex with women) adolescents, in comparison with heterosexual adolescents, have higher rates of depression and suicidal ideation, higher rates of substance abuse, and more risky sexual behaviors. Obtaining a comprehensive, confidential, developmentally appropriate adolescent psychosocial history allows for the discovery of strengths and assets as well as risks. Pediatricians should have offices that are teen-friendly and welcoming to sexual minority youth. This includes having supportive, engaging office staff members who ensure that there are no barriers to care. For transgender youth, pediatricians should provide the opportunity to acknowledge and affirm their feelings of gender dysphoria and desires to transition to the opposite gender. Referral of transgender youth to a qualified mental health professional is critical to assist with the dysphoria, to educate them, and to assess their readiness for transition. With appropriate assistance and care, sexual minority youth should live healthy, productive lives while transitioning through adolescence and young adulthood. (6/13)

OFFICE-BASED COUNSELING FOR UNINTENTIONAL INJURY PREVENTION (CLINICAL REPORT)

H. Garry Gardner, MD, and Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Unintentional injuries are the leading cause of death for children older than 1 year. Pediatricians should include unintentional injury prevention as a major component of anticipatory guidance for infants, children, and adolescents. The content of injury-prevention counseling varies for infants, preschool-aged children, school-aged children, and adolescents. This report provides guidance on the content of unintentional injury-prevention counseling for each of those age groups. (1/07)

OFF-LABEL USE OF DRUGS IN CHILDREN

Committee on Drugs

ABSTRACT. The passage of the Best Pharmaceuticals for Children Act and the Pediatric Research Equity Act has collectively resulted in an improvement in rational prescribing for children, including more than 500 labeling changes. However, off-label drug use remains an important public health issue for infants, children, and adolescents, because an overwhelming number of drugs still have no information in the labeling for use in pediatrics. The purpose of off-label use is to benefit the individual patient. Practitioners use their professional judgment to determine these uses. As such, the term "off-label" does not imply an improper, illegal, contraindicated, or investigational use. Therapeutic decision-making must always rely on the best available evidence and the importance of the benefit for the individual patient. (2/14)

See full text on page 797.

OPHTHALMOLOGIC EXAMINATIONS IN CHILDREN WITH JUVENILE RHEUMATOID ARTHRITIS (CLINICAL REPORT)

James Cassidy, MD; Jane Kirolin, MD; Carol Lindsley, MD; James Nocton, MD; Section on Rheumatology; and Section on Ophthalmology

ABSTRACT. Unlike the joints, ocular involvement with juvenile rheumatoid arthritis is most often asymptomatic; yet, the inflammation can cause serious morbidity with loss of vision. Scheduled slit-lamp examinations by an ophthalmologist at specific intervals can detect ocular disease early, and prompt treatment can prevent vision loss. (5/06)

OPTIMIZING BONE HEALTH IN CHILDREN AND ADOLESCENTS (CLINICAL REPORT)

Neville H. Golden, MD; Steven A. Abrams, MD; and Committee on Nutrition

ABSTRACT. The pediatrician plays a major role in helping optimize bone health in children and adolescents. This clinical report reviews normal bone acquisition in infants, children, and adolescents and discusses factors affecting bone health in this age group. Previous recommended daily allowances for calcium and vitamin D are updated, and clinical guidance is provided regarding weight-bearing activities and recommendations for calcium and vitamin D intake and supplementation. Routine calcium supplementation is not recommended for healthy children and adolescents, but increased dietary intake to meet daily requirements is encouraged. The American Academy of Pediatrics endorses the higher recommended dietary allowances for vitamin D advised by the Institute of Medicine and supports testing for vitamin D deficiency in children and adolescents with conditions associated with increased bone fragility. Universal screening for vitamin D deficiency is not routinely recommended in healthy children or in children with dark skin or obesity because there is insufficient evidence of the cost-benefit of such a practice in reducing fracture risk. The preferred test to assess bone health is dual-energy x-ray absorptiometry, but caution is advised when interpreting results in children and adolescents who may not yet have achieved peak bone mass. For analyses, z scores should be used instead of T scores, and corrections should be made for size. Office-based strategies for the pediatrician to optimize bone health are provided. This clinical report has been endorsed by American Bone Health. (9/14)

See full text on page 805.

ORAL AND DENTAL ASPECTS OF CHILD ABUSE AND NEGLECT (CLINICAL REPORT)

Nancy Kellogg, MD, and Committee on Child Abuse and Neglect (joint with American Academy of Pediatric Dentistry)

ABSTRACT. In all 50 states, physicians and dentists are required to report suspected cases of abuse and neglect to social service or law enforcement agencies. The purpose of this report is to review the oral and dental aspects of physical and sexual abuse and dental neglect and the role of physicians and dentists in evaluating such conditions. This report addresses the evaluation of bite marks

as well as perioral and intraoral injuries, infections, and diseases that may cause suspicion for child abuse or neglect. Physicians receive minimal training in oral health and dental injury and disease and, thus, may not detect dental aspects of abuse or neglect as readily as they do child abuse and neglect involving other areas of the body. Therefore, physicians and dentists are encouraged to collaborate to increase the prevention, detection, and treatment of these conditions. (12/05, reaffirmed 1/09, 1/14)

ORAL HEALTH CARE FOR CHILDREN WITH DEVELOPMENTAL DISABILITIES (CLINICAL REPORT)

Kenneth W. Norwood, Jr, MD; Rebecca L. Slayton, DDS, PhD; Council on Children With Disabilities; and Section on Oral Health

ABSTRACT. Children with developmental disabilities often have unmet complex health care needs as well as significant physical and cognitive limitations. Children with more severe conditions and from low-income families are particularly at risk with high dental needs and poor access to care. In addition, children with developmental disabilities are living longer, requiring continued oral health care. This clinical report describes the effect that poor oral health has on children with developmental disabilities as well as the importance of partnerships between the pediatric medical and dental homes. Basic knowledge of the oral health risk factors affecting children with developmental disabilities is provided. Pediatricians may use the report to guide their incorporation of oral health assessments and education into their well-child examinations for children with developmental disabilities. This report has medical, legal, educational, and operational implications for practicing pediatricians. (2/13)

ORAL HEALTH RISK ASSESSMENT TIMING AND ESTABLISHMENT OF THE DENTAL HOME

Section on Pediatric Dentistry

ABSTRACT. Early childhood dental caries has been reported by the Centers for Disease Control and Prevention to be perhaps the most prevalent infectious disease of our nation's children. Early childhood dental caries occurs in all racial and socioeconomic groups; however, it tends to be more prevalent in low-income children, in whom it occurs in epidemic proportions. Dental caries results from an overgrowth of specific organisms that are a part of normally occurring human flora. Human dental flora is site specific, and an infant is not colonized until the eruption of the primary dentition at approximately 6 to 30 months of age. The most likely source of inoculation of an infant's dental flora is the mother or another intimate care provider, through shared utensils, etc. Decreasing the level of cariogenic organisms in the mother's dental flora at the time of colonization can significantly impact the child's predisposition to caries. To prevent caries in children, high-risk individuals must be identified at an early age (preferably high-risk mothers during prenatal care), and aggressive strategies should be adopted, including anticipatory guidance, behavior modifications (oral hygiene and feeding practices), and establishment of a dental home by 1 year of age for children deemed at risk. (5/03, reaffirmed 5/09)

ORGANIC FOODS: HEALTH AND ENVIRONMENTAL ADVANTAGES AND DISADVANTAGES (CLINICAL REPORT)

Joel Forman, MD; Janet Silverstein, MD; Committee on Nutrition; and Council on Environmental Health

ABSTRACT. The US market for organic foods has grown from \$3.5 billion in 1996 to \$28.6 billion in 2010, according to the Organic Trade Association. Organic products are now sold in specialty stores and conventional supermarkets. Organic products contain numerous marketing claims and terms, only some of which are standardized and regulated.

In terms of health advantages, organic diets have been convincingly demonstrated to expose consumers to fewer pesticides associated with human disease. Organic farming has been demonstrated to have less environmental impact than conventional approaches. However, current evidence does not support any meaningful nutritional benefits or deficits from eating organic compared with conventionally grown foods, and there are no well-powered human studies that directly demonstrate health benefits or disease protection as a result of consuming an organic diet. Studies also have not demonstrated any detrimental or disease-promoting effects from an organic diet. Although organic foods regularly command a significant price premium, well-designed farming studies demonstrate that costs can be competitive and yields comparable to those of conventional farming techniques. Pediatricians should incorporate this evidence when discussing the health and environmental impact of organic foods and organic farming while continuing to encourage all patients and their families to attain optimal nutrition and dietary variety consistent with the US Department of Agriculture's MyPlate recommendations.

This clinical report reviews the health and environmental issues related to organic food production and consumption. It defines the term "organic," reviews organic food-labeling standards, describes organic and conventional farming practices, and explores the cost and environmental implications of organic production techniques. It examines the evidence available on nutritional quality and production contaminants in conventionally produced and organic foods. Finally, this report provides guidance for pediatricians to assist them in advising their patients regarding organic and conventionally produced food choices. (10/12)

ORGANIZED SPORTS FOR CHILDREN AND PREADOLESCENTS

Committee on Sports Medicine and Fitness and Committee on School Health

ABSTRACT. Participation in organized sports provides an opportunity for young people to increase their physical activity and develop physical and social skills. However, when the demands and expectations of organized sports exceed the maturation and readiness of the participant, the positive aspects of participation can be negated. The nature of parental or adult involvement can also influence the degree to which participation in organized sports is a positive experience for preadolescents. This updates a previous policy statement on athletics for preadolescents and incorporates guidelines for sports participation for

preschool children. Recommendations are offered on how pediatricians can help determine a child's readiness to participate, how risks can be minimized, and how child-oriented goals can be maximized. (6/01, reaffirmed 1/05, 6/11)

OUT-OF-HOME PLACEMENT FOR CHILDREN AND ADOLESCENTS WITH DISABILITIES (CLINICAL REPORT)

Sandra L. Friedman, MD, MPH; Miriam A. Kalichman, MD; and Council on Children With Disabilities

ABSTRACT. The vast majority of children and youth with chronic and complex health conditions who also have intellectual and developmental disabilities are cared for in their homes. Social, legal, policy, and medical changes through the years have allowed for an increase in needed support within the community. However, there continues to be a relatively small group of children who live in various types of congregate care settings. This clinical report describes these settings and the care and services that are provided in them. The report also discusses reasons families choose out-of-home placement for their children, barriers to placement, and potential effects of this decision on family members. We examine the pediatrician's role in caring for children with severe intellectual and developmental disabilities and complex medical problems in the context of responding to parental inquiries about out-of-home placement and understanding factors affecting these types of decisions. Common medical problems and care issues for children residing outside the family home are reviewed. Variations in state and federal regulations, challenges in understanding local systems, and access to services are also discussed. (9/14)

See full text on page 823.

OUT-OF-SCHOOL SUSPENSION AND EXPULSION

Council on School Health

ABSTRACT. The primary mission of any school system is to educate students. To achieve this goal, the school district must maintain a culture and environment where all students feel safe, nurtured, and valued and where order and civility are expected standards of behavior. Schools cannot allow unacceptable behavior to interfere with the school district's primary mission. To this end, school districts adopt codes of conduct for expected behaviors and policies to address unacceptable behavior. In developing these policies, school boards must weigh the severity of the offense and the consequences of the punishment and the balance between individual and institutional rights and responsibilities. Out-of-school suspension and expulsion are the most severe consequences that a school district can impose for unacceptable behavior. Traditionally, these consequences have been reserved for offenses deemed especially severe or dangerous and/or for recalcitrant offenders. However, the implications and consequences of out-of-school suspension and expulsion and "zero-tolerance" are of such severity that their application and appropriateness for a developing child require periodic review. The indications and effectiveness of exclusionary discipline policies that demand automatic or rigorous application are increasingly questionable. The impact of these policies on offenders, other children, school districts, and communities is broad. Periodic scru-

tiny of policies should be placed not only on the need for a better understanding of the educational, emotional, and social impact of out-of-school suspension and expulsion on the individual student but also on the greater societal costs of such rigid policies. Pediatricians should be prepared to assist students and families affected by out-of-school suspension and expulsion and should be willing to guide school districts in their communities to find more effective and appropriate alternatives to exclusionary discipline policies for the developing child. A discussion of preventive strategies and alternatives to out-of-school suspension and expulsion, as well as recommendations for the role of the physician in matters of out-of-school suspension and expulsion are included. School-wide positive behavior support/positive behavior intervention and support is discussed as an effective alternative. (2/13)

OVERCROWDING CRISIS IN OUR NATION'S EMERGENCY DEPARTMENTS: IS OUR SAFETY NET UNRAVELING?

Committee on Pediatric Emergency Medicine

ABSTRACT. Emergency departments (EDs) are a vital component in our health care safety net, available 24 hours a day, 7 days a week, for all who require care. There has been a steady increase in the volume and acuity of patient visits to EDs, now with well over 100 million Americans (30 million children) receiving emergency care annually. This rise in ED utilization has effectively saturated the capacity of EDs and emergency medical services in many communities. The resulting phenomenon, commonly referred to as ED overcrowding, now threatens access to emergency services for those who need them the most. As managers of the pediatric medical home and advocates for children and optimal pediatric health care, there is a very important role for pediatricians and the American Academy of Pediatrics in guiding health policy decision-makers toward effective solutions that promote the medical home and timely access to emergency care. (9/04, reaffirmed 5/07, 6/11)

OVERUSE INJURIES, OVERTRAINING, AND BURNOUT IN CHILD AND ADOLESCENT ATHLETES (CLINICAL REPORT)

Joel S. Brenner, MD, MPH, and Council on Sports Medicine and Fitness

ABSTRACT. Overuse is one of the most common etiologic factors that lead to injuries in the pediatric and adolescent athlete. As more children are becoming involved in organized and recreational athletics, the incidence of overuse injuries is increasing. Many children are participating in sports year-round and sometimes on multiple teams simultaneously. This overtraining can lead to burnout, which may have a detrimental effect on the child participating in sports as a lifelong healthy activity. One contributing factor to overtraining may be parental pressure to compete and succeed. The purpose of this clinical report is to assist pediatricians in identifying and counseling at-risk children and their families. This report supports the American Academy of Pediatrics policy statement on intensive training and sport specialization. (6/07, reaffirmed 3/11, 6/14)

PALLIATIVE CARE FOR CHILDREN

Committee on Bioethics and Committee on Hospital Care

ABSTRACT. This statement presents an integrated model for providing palliative care for children living with a life-threatening or terminal condition. Advice on the development of a palliative care plan and on working with parents and children is also provided. Barriers to the provision of effective pediatric palliative care and potential solutions are identified. The American Academy of Pediatrics recommends the development and broad availability of pediatric palliative care services based on child-specific guidelines and standards. Such services will require widely distributed and effective palliative care education of pediatric health care professionals. The Academy offers guidance on responding to requests for hastening death, but does not support the practice of physician-assisted suicide or euthanasia for children. (8/00, reaffirmed 6/03, 10/06, 2/12)

PARENT-PROVIDER-COMMUNITY PARTNERSHIPS: OPTIMIZING OUTCOMES FOR CHILDREN WITH DISABILITIES (CLINICAL REPORT)

Nancy A. Murphy, MD; Paul S. Carbone, MD; and Council on Children With Disabilities

ABSTRACT. Children with disabilities and their families have multifaceted medical, developmental, educational, and habilitative needs that are best addressed through strong partnerships among parents, providers, and communities. However, traditional health care systems are designed to address acute rather than chronic conditions. Children with disabilities require high-quality medical homes that provide care coordination and transitional care, and their families require social and financial supports. Integrated community systems of care that promote participation of all children are needed. The purpose of this clinical report is to explore the challenges of developing effective community-based systems of care and to offer suggestions to pediatricians and policy-makers regarding the development of partnerships among children with disabilities, their families, and health care and other providers to maximize health and well-being of these children and their families. (9/11)

PARENTAL LEAVE FOR RESIDENTS AND PEDIATRIC TRAINING PROGRAMS

Section on Medical Students, Residents, and Fellowship

Trainees and Committee on Early Childhood

ABSTRACT. The American Academy of Pediatrics (AAP) is committed to the development of rational, equitable, and effective parental leave policies that are sensitive to the needs of pediatric residents, families, and developing infants and that enable parents to spend adequate and good-quality time with their young children. It is important for each residency program to have a policy for parental leave that is written, that is accessible to residents, and that clearly delineates program practices regarding parental leave. At a minimum, a parental leave policy for residents and fellows should conform legally with the Family Medical Leave Act as well as with respective state laws and should meet institutional requirements of the Accreditation Council for Graduate Medical Education for accredited programs. Policies should be well formulated

and communicated in a culturally sensitive manner. The AAP advocates for extension of benefits consistent with the Family Medical Leave Act to all residents and interns beginning at the time that pediatric residency training begins. The AAP recommends that regardless of gender, residents who become parents should be guaranteed 6 to 8 weeks, at a minimum, of parental leave with pay after the infant's birth. In addition, in conformance with federal law, the resident should be allowed to extend the leave time when necessary by using paid vacation time or leave without pay. Coparenting, adopting, or fostering of a child should entitle the resident, regardless of gender, to the same amount of paid leave (6–8 weeks) as a person who takes maternity/paternity leave. Flexibility, creativity, and advanced planning are necessary to arrange schedules that optimize resident education and experience, cultivate equity in sharing workloads, and protect pregnant residents from overly strenuous work experiences at critical times of their pregnancies. (1/13)

PATIENT- AND FAMILY-CENTERED CARE AND THE PEDIATRICIAN'S ROLE

Committee on Hospital Care and Institute for Patient- and Family-Centered Care

ABSTRACT. Drawing on several decades of work with families, pediatricians, other health care professionals, and policy makers, the American Academy of Pediatrics provides a definition of patient- and family-centered care. In pediatrics, patient- and family-centered care is based on the understanding that the family is the child's primary source of strength and support. Further, this approach to care recognizes that the perspectives and information provided by families, children, and young adults are essential components of high-quality clinical decision-making, and that patients and family are integral partners with the health care team. This policy statement outlines the core principles of patient- and family-centered care, summarizes some of the recent literature linking patient- and family-centered care to improved health outcomes, and lists various other benefits to be expected when engaging in patient- and family-centered pediatric practice. The statement concludes with specific recommendations for how pediatricians can integrate patient- and family-centered care in hospitals, clinics, and community settings, and in broader systems of care, as well. (1/12)

PATIENT- AND FAMILY-CENTERED CARE AND THE ROLE OF THE EMERGENCY PHYSICIAN PROVIDING CARE TO A CHILD IN THE EMERGENCY DEPARTMENT

Committee on Pediatric Emergency Medicine (joint with American College of Emergency Physicians)

ABSTRACT. Patient- and family-centered care is an approach to health care that recognizes the role of the family in providing medical care; encourages collaboration between the patient, family, and health care professionals; and honors individual and family strengths, cultures, traditions, and expertise. Although there are many opportunities for providing patient- and family-centered care in the emergency department, there are also challenges to doing so. The American Academy of Pediatrics and the American College of Emergency Physicians support promoting patient dignity, comfort, and autonomy; rec-

ognizing the patient and family as key decision-makers in the patient's medical care; recognizing the patient's experience and perspective in a culturally sensitive manner; acknowledging the interdependence of child and parent as well as the pediatric patient's evolving independence; encouraging family-member presence; providing information to the family during interventions; encouraging collaboration with other health care professionals; acknowledging the importance of the patient's medical home; and encouraging institutional policies for patient- and family-centered care. (11/06, reaffirmed 6/09, 10/11)

**PATIENT- AND FAMILY-CENTERED CARE
COORDINATION: A FRAMEWORK FOR INTEGRATING
CARE FOR CHILDREN AND YOUTH ACROSS MULTIPLE
SYSTEMS**

*Council on Children With Disabilities and Medical Home
Implementation Project Advisory Committee*

ABSTRACT. Understanding a care coordination framework, its functions, and its effects on children and families is critical for patients and families themselves, as well as for pediatricians, pediatric medical subspecialists/surgical specialists, and anyone providing services to children and families. Care coordination is an essential element of a transformed American health care delivery system that emphasizes optimal quality and cost outcomes, addresses family-centered care, and calls for partnership across various settings and communities. High-quality, cost-effective health care requires that the delivery system include elements for the provision of services supporting the coordination of care across settings and professionals. This requirement of supporting coordination of care is generally true for health systems providing care for all children and youth but especially for those with special health care needs. At the foundation of an efficient and effective system of care delivery is the patient-/family-centered medical home. From its inception, the medical home has had care coordination as a core element. In general, optimal outcomes for children and youth, especially those with special health care needs, require interfacing among multiple care systems and individuals, including the following: medical, social, and behavioral professionals; the educational system; payers; medical equipment providers; home care agencies; advocacy groups; needed supportive therapies/services; and families. Coordination of care across settings permits an integration of services that is centered on the comprehensive needs of the patient and family, leading to decreased health care costs, reduction in fragmented care, and improvement in the patient/family experience of care. (4/14)

See full text on page 837.

**PATIENT- AND FAMILY-CENTERED CARE OF
CHILDREN IN THE EMERGENCY DEPARTMENT
(TECHNICAL REPORT)**

*Patricia J. O'Malley, MD; Kathleen Brown, MD; Steven
E. Krug, MD; and Committee on Pediatric Emergency
Medicine*

ABSTRACT. Patient- and family-centered care is an innovative approach to the planning, delivery, and evaluation of health care that is grounded in a mutually beneficial partnership among patients, families, and health care

professionals. Providing patient- and family-centered care to children in the emergency department setting presents many opportunities and challenges. This technical report draws on previously published policy statements and reports, reviews the current literature, and describes the present state of practice and research regarding patient- and family-centered care for children in the emergency department setting as well as some of the complexities of providing such care. This technical report has been endorsed by the Academic Pediatric Association (formerly the Ambulatory Pediatric Association), the American College of Osteopathic Emergency Physicians, the National Association of Emergency Medical Technicians, the Institute for Family-Centered Care, and the American College of Emergency Physicians. This report is also supported by the Emergency Nurses Association. (8/08)

**PATIENT SAFETY IN THE PEDIATRIC EMERGENCY
CARE SETTING**

Committee on Pediatric Emergency Medicine

ABSTRACT. Patient safety is a priority for all health care professionals, including those who work in emergency care. Unique aspects of pediatric care may increase the risk of medical error and harm to patients, especially in the emergency care setting. Although errors can happen despite the best human efforts, given the right set of circumstances, health care professionals must work proactively to improve safety in the pediatric emergency care system. Specific recommendations to improve pediatric patient safety in the emergency department are provided in this policy statement. (12/07, reaffirmed 6/11, 7/14)

PAYMENT FOR TELEPHONE CARE

*Section on Telephone Care and Committee on Child Health
Financing*

ABSTRACT. Telephone care in pediatrics requires medical judgment, is associated with practice expense and medical liability risk, and can often substitute for more costly face-to-face care. Despite this, physicians are infrequently paid by patients or third-party payors for medical services provided by telephone. As the costs of maintaining a practice continue to increase, pediatricians are increasingly seeking payment for the time and work involved in telephone care. This statement reviews the role of telephone care in pediatric practice, the current state of payment for telephone care, and the practical issues associated with charging for telephone care services, a service traditionally provided gratis to patients and families. Specific recommendations are presented for appropriate documenting, reporting, and billing for telephone care services. (10/06)

PEDESTRIAN SAFETY

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Each year, approximately 900 pediatric pedestrians younger than 19 years are killed. In addition, 51000 children are injured as pedestrians, and 5300 of them are hospitalized because of their injuries. Parents should be warned that young children often do not have the cognitive, perceptual, and behavioral abilities to negotiate traffic independently. Parents should also be informed about the danger of vehicle back-over injuries to toddlers playing in driveways. Because posttraumatic stress syn-

drome commonly follows even minor pedestrian injury, pediatricians should screen and refer for this condition as necessary. The American Academy of Pediatrics supports community- and school-based strategies that minimize a child's exposure to traffic, especially to high-speed, high-volume traffic. Furthermore, the American Academy of Pediatrics supports governmental and industry action that would lead to improvements in vehicle design, driver manuals, driver education, and data collection for the purpose of reducing pediatric pedestrian injury. (7/09, reaffirmed 8/13)

PEDIATRIC AND ADOLESCENT MENTAL HEALTH EMERGENCIES IN THE EMERGENCY MEDICAL SERVICES SYSTEM (TECHNICAL REPORT)

Margaret A. Dolan, MD; Joel A. Fein, MD, MPH; and Committee on Pediatric Emergency Medicine

ABSTRACT. Emergency department (ED) health care professionals often care for patients with previously diagnosed psychiatric illnesses who are ill, injured, or having a behavioral crisis. In addition, ED personnel encounter children with psychiatric illnesses who may not present to the ED with overt mental health symptoms. Staff education and training regarding identification and management of pediatric mental health illness can help EDs overcome the perceived limitations of the setting that influence timely and comprehensive evaluation. In addition, ED physicians can inform and advocate for policy changes at local, state, and national levels that are needed to ensure comprehensive care of children with mental health illnesses. This report addresses the roles that the ED and ED health care professionals play in emergency mental health care of children and adolescents in the United States, which includes the stabilization and management of patients in mental health crisis, the discovery of mental illnesses and suicidal ideation in ED patients, and approaches to advocating for improved recognition and treatment of mental illnesses in children. The report also addresses special issues related to mental illness in the ED, such as minority populations, children with special health care needs, and children's mental health during and after disasters and trauma. (4/11, reaffirmed 7/14)

PEDIATRIC ANTHRAX CLINICAL MANAGEMENT (CLINICAL REPORT)

John S. Bradley, MD, FAAP, FIDSA, FPIDS; Georgina Peacock, MD, MPH, FAAP; Steven E. Krug, MD, FAAP; William A. Bower, MD, FIDSA; Amanda C. Cohn, MD; Dana Meaney-Delman, MD, MPH, FACOG; Andrew T. Pavia, MD, FAAP, FIDSA; Committee on Infectious Diseases; and Disaster Preparedness Advisory Council

ABSTRACT. Anthrax is a zoonotic disease caused by *Bacillus anthracis*, which has multiple routes of infection in humans, manifesting in different initial presentations of disease. Because *B anthracis* has the potential to be used as a biological weapon and can rapidly progress to systemic anthrax with high mortality in those who are exposed and untreated, clinical guidance that can be quickly implemented must be in place before any intentional release of the agent. This document provides clinical guidance for the prophylaxis and treatment of neonates, infants, children, adolescents, and young adults up to the age of

21 (referred to as "children") in the event of a deliberate *B anthracis* release and offers guidance in areas where the unique characteristics of children dictate a different clinical recommendation from adults. (4/14)

See full text on page 849.

PEDIATRIC ANTHRAX CLINICAL MANAGEMENT: EXECUTIVE SUMMARY (CLINICAL REPORT)

John S. Bradley, MD, FAAP, FIDSA, FPIDS; Georgina Peacock, MD, MPH, FAAP; Steven E. Krug, MD, FAAP; William A. Bower, MD, FIDSA; Amanda C. Cohn, MD; Dana Meaney-Delman, MD, MPH, FACOG; Andrew T. Pavia, MD, FAAP, FIDSA; Committee on Infectious Diseases; and Disaster Preparedness Advisory Council

The use of *Bacillus anthracis* as a biological weapon is considered a potential national security threat by the US government. *B anthracis* has the ability to be used as a biological weapon and to cause anthrax, which can rapidly progress to systemic disease with high mortality in those who are untreated. Therefore, clear plans for managing children after a *B anthracis* bioterror exposure event must be in place before any intentional release of the agent. This document provides a summary of the guidance contained in the clinical report (appendices cited in this executive summary refer to those in the clinical report) for diagnosis and management of anthrax, including antimicrobial treatment and postexposure prophylaxis (PEP), use of antitoxin, and recommendations for use of anthrax vaccine in neonates, infants, children, adolescents, and young adults up to the age of 21 years (referred to as "children"). (4/14)

See full text on page 877.

PEDIATRIC ASPECTS OF INPATIENT HEALTH INFORMATION TECHNOLOGY SYSTEMS (TECHNICAL REPORT)

George R. Kim; Christoph U. Lehmann, MD; and Council on Clinical Information Technology

ABSTRACT. US adoption of health information technology as a path to improved quality of patient care (effectiveness, safety, timeliness, patient-centeredness, efficiency, and equity) has been promoted by the medical community. Children and infants (especially those with special health care needs) are at higher risk than are adults for medical errors and their consequences (particularly in environments in which children are not the primary patient population). However, development and adoption of health information technology tools and practices that promote pediatric quality and patient safety are lagging. Two inpatient clinical processes—medication delivery and patient care transitions—are discussed in terms of health information technology applications that support them and functions that are important to pediatric quality and safety. Pediatricians and their partners (pediatric nurses, pharmacists, etc) must develop awareness of technical and adaptive issues in adopting these tools and collaborate with organizational leaders and developers as advocates for the best interests and safety of pediatric patients. Pediatric health information technology adoption cannot be considered in terms of applications (such as electronic health records or computerized physician order entry) alone but must be considered globally in terms of

technical (health information technology applications), organizational (structures and workflows of care), and cultural (stakeholders) aspects of what is best. (12/08)

PEDIATRIC CARE RECOMMENDATIONS FOR FREESTANDING URGENT CARE FACILITIES

Committee on Pediatric Emergency Medicine

ABSTRACT. Treatment of children at freestanding urgent care facilities has become common in pediatric health care. Well-managed freestanding urgent care facilities can improve the health of the children in their communities, integrate into the medical community, and provide a safe, effective adjunct to, but not a replacement for, the medical home or emergency department. Recommendations are provided for optimizing freestanding urgent care facilities' quality, communication, and collaboration in caring for children. (4/14)

See full text on page 883.

PEDIATRIC FELLOWSHIP TRAINING

Federation of Pediatric Organizations (7/04)

PEDIATRIC MENTAL HEALTH EMERGENCIES IN THE EMERGENCY MEDICAL SERVICES SYSTEM

Committee on Pediatric Emergency Medicine (joint with American College of Emergency Physicians)

ABSTRACT. Emergency departments are vital in the management of pediatric patients with mental health emergencies. Pediatric mental health emergencies are an increasing part of emergency medical practice because emergency departments have become the safety net for a fragmented mental health infrastructure that is experiencing critical shortages in services in all sectors. Emergency departments must safely, humanely, and in a culturally and developmentally appropriate manner manage pediatric patients with undiagnosed and known mental illnesses, including those with mental retardation, autistic spectrum disorders, and attention-deficit/hyperactivity disorder and those experiencing a behavioral crisis. Emergency departments also manage patients with suicidal ideation, depression, escalating aggression, substance abuse, post-traumatic stress disorder, and maltreatment and those exposed to violence and unexpected deaths. Emergency departments must address not only the physical but also the mental health needs of patients during and after mass-casualty incidents and disasters. The American Academy of Pediatrics and the American College of Emergency Physicians support advocacy for increased mental health resources, including improved pediatric mental health tools for the emergency department, increased mental health insurance coverage, and adequate reimbursement at all levels; acknowledgment of the importance of the child's medical home; and promotion of education and research for mental health emergencies. (10/06, reaffirmed 6/09, 4/13)

PEDIATRIC OBSERVATION UNITS (CLINICAL REPORT)

Gregory P. Connors, MD, MPH, MBA; Sanford M. Melzer, MD, MBA; Committee on Hospital Care; and Committee on Pediatric Emergency Medicine

ABSTRACT. Pediatric observation units (OUs) are hospital areas used to provide medical evaluation and/or management for health-related conditions in children,

typically for a well-defined, brief period. Pediatric OUs represent an emerging alternative site of care for selected groups of children who historically may have received their treatment in an ambulatory setting, emergency department, or hospital-based inpatient unit. This clinical report provides an overview of pediatric OUs, including the definitions and operating characteristics of different types of OUs, quality considerations and coding for observation services, and the effect of OUs on inpatient hospital utilization. (6/12)

PEDIATRIC ORGAN DONATION AND TRANSPLANTATION

Committee on Hospital Care, Section on Surgery, and Section on Critical Care

ABSTRACT. Pediatric organ donation and organ transplantation can have a significant life-extending benefit to the young recipients of these organs and a high emotional impact on donor and recipient families. Pediatricians, pediatric medical specialists, and pediatric transplant surgeons need to be better acquainted with evolving national strategies that involve organ procurement and organ transplantation to help acquaint families with the benefits and risks of organ donation and transplantation. Efforts of pediatric professionals are needed to shape public policies to provide a system in which procurement, distribution, and cost are fair and equitable to children and adults. Major issues of concern are availability of and access to donor organs; oversight and control of the process; pediatric medical and surgical consultation and continued care throughout the organ-donation and transplantation process; ethical, social, financial, and follow-up issues; insurance-coverage issues; and public awareness of the need for organ donors of all ages. (3/10, reaffirmed 3/14)

PEDIATRIC PALLIATIVE CARE AND HOSPICE CARE COMMITMENTS, GUIDELINES, AND RECOMMENDATIONS

Section on Hospice and Palliative Medicine and Committee on Hospital Care

ABSTRACT. Pediatric palliative care and pediatric hospice care (PPC-PHC) are often essential aspects of medical care for patients who have life-threatening conditions or need end-of-life care. PPC-PHC aims to relieve suffering, improve quality of life, facilitate informed decision-making, and assist in care coordination between clinicians and across sites of care. Core commitments of PPC-PHC include being patient centered and family engaged; respecting and partnering with patients and families; pursuing care that is high quality, readily accessible, and equitable; providing care across the age spectrum and life span, integrated into the continuum of care; ensuring that all clinicians can provide basic palliative care and consult PPC-PHC specialists in a timely manner; and improving care through research and quality improvement efforts. PPC-PHC guidelines and recommendations include ensuring that all large health care organizations serving children with life-threatening conditions have dedicated interdisciplinary PPC-PHC teams, which should develop collaborative relationships between hospital- and community-based teams; that PPC-PHC be provided as integrated multimodal care and practiced as a cornerstone

of patient safety and quality for patients with life-threatening conditions; that PPC-PHC teams should facilitate clear, compassionate, and forthright discussions about medical issues and the goals of care and support families, siblings, and health care staff; that PPC-PHC be part of all pediatric education and training curricula, be an active area of research and quality improvement, and exemplify the highest ethical standards; and that PPC-PHC services be supported by financial and regulatory arrangements to ensure access to high-quality PPC-PHC by all patients with life-threatening and life-shortening diseases. (10/13)

PEDIATRIC PRIMARY HEALTH CARE

Committee on Pediatric Workforce

ABSTRACT. Primary health care is described as accessible and affordable, first contact, continuous and comprehensive, and coordinated to meet the health needs of the individual and the family being served.

Pediatric primary health care encompasses health supervision and anticipatory guidance; monitoring physical and psychosocial growth and development; age-appropriate screening; diagnosis and treatment of acute and chronic disorders; management of serious and life-threatening illness and, when appropriate, referral of more complex conditions; and provision of first contact care as well as coordinated management of health problems requiring multiple professional services.

Pediatric primary health care for children and adolescents is family centered and incorporates community resources and strengths, needs and risk factors, and sociocultural sensitivities into strategies for care delivery and clinical practice. Pediatric primary health care is best delivered within the context of a "medical home," where comprehensive, continuously accessible and affordable care is available and delivered or supervised by qualified child health specialists.

The pediatrician, because of training (which includes 4 years of medical school education, plus an additional 3 or more years of intensive training devoted solely to all aspects of medical care for children and adolescents), coupled with the demonstrated interest in and total professional commitment to the health care of infants, children, adolescents, and young adults, is the most appropriate provider of pediatric primary health care. (1/11, reaffirmed 10/13)

PEDIATRIC SUDDEN CARDIAC ARREST

Section on Cardiology and Cardiac Surgery

ABSTRACT. Pediatric sudden cardiac arrest (SCA), which can cause sudden cardiac death if not treated within minutes, has a profound effect on everyone: children, parents, family members, communities, and health care providers. Preventing the tragedy of pediatric SCA, defined as the abrupt and unexpected loss of heart function, remains a concern to all. The goal of this statement is to increase the knowledge of pediatricians (including primary care providers and specialists) of the incidence of pediatric SCA, the spectrum of causes of pediatric SCA, disease-specific presentations, the role of patient and family screening, the rapidly evolving role of genetic testing, and finally, important aspects of secondary SCA prevention. This statement is not intended to address sudden infant death syndrome

or sudden unexplained death syndrome, nor will specific treatment of individual cardiac conditions be discussed. This statement has been endorsed by the American College of Cardiology, the American Heart Association, and the Heart Rhythm Society. (3/12)

THE PEDIATRICIAN AND CHILDHOOD BEREAVEMENT

Committee on Psychosocial Aspects of Child and

Family Health

ABSTRACT. Pediatricians should understand and evaluate children's reactions to the death of a person important to them by using age-appropriate and culturally sensitive guidance while being alert for normal and complicated grief responses. Pediatricians also should advise and assist families in responding to the child's needs. Sharing, family support, and communication have been associated with positive long-term bereavement adjustment. (2/00, reaffirmed 1/04, 3/13)

THE PEDIATRICIAN AND DISASTER PREPAREDNESS

Committee on Pediatric Emergency Medicine, Committee on

Medical Liability, and Task Force on Terrorism

ABSTRACT. Recent natural disasters and events of terrorism and war have heightened society's recognition of the need for emergency preparedness. In addition to the unique pediatric issues involved in general emergency preparedness, several additional issues related to terrorism preparedness must be considered, including the unique vulnerabilities of children to various agents as well as the limited availability of age- and weight-appropriate antidotes and treatments. Although children may respond more rapidly to therapeutic intervention, they are at the same time more susceptible to various agents and conditions and more likely to deteriorate if not monitored carefully.

The challenge of dealing with the threat of terrorism, natural disasters, and public health emergencies in the United States is daunting not only for disaster planners but also for our medical system and health professionals of all types, including pediatricians. As part of the network of health responders, pediatricians need to be able to answer concerns of patients and families, recognize signs of possible exposure to a weapon of terror, understand first-line response to such attacks, and sufficiently participate in disaster planning to ensure that the unique needs of children are addressed satisfactorily in the overall process. Pediatricians play a central role in disaster and terrorism preparedness with families, children, and their communities. This applies not only to the general pediatrician but also to the pediatric medical subspecialist and pediatric surgical specialist. Families view pediatricians as their expert resource, and most of them expect the pediatrician to be knowledgeable in areas of concern. Providing expert guidance entails educating families in anticipation of events and responding to questions during and after actual events. It is essential that pediatricians educate themselves regarding these issues of emergency preparedness.

For pediatricians, some information is currently available on virtually all of these issues in recently produced printed materials, at special conferences, in broadcasts of various types, and on the Internet. However, selecting

appropriate, accurate sources of information and determining how much information is sufficient remain difficult challenges. Similarly, guidance is needed with respect to developing relevant curricula for medical students and postdoctoral clinical trainees. (2/06, reaffirmed 6/09, 9/13)

THE PEDIATRICIAN WORKFORCE: CURRENT STATUS AND FUTURE PROSPECTS (TECHNICAL REPORT)

David C. Goodman, MD, MS, and Committee on Pediatric Workforce

ABSTRACT. The effective and efficient delivery of children's health care depends on the pediatrician workforce. The number, composition, and distribution of pediatricians necessary to deliver this care have been the subject of long-standing policy and professional debate. This technical report reviews current characteristics and recent trends in the pediatric workforce and couples the workforce to a conceptual model of improvement in children's health and well-being. Important recent changes in the workforce include (1) the growth in the number of pediatricians in relation to the child population, (2) increased numbers of female pediatricians and their attainment of majority gender status in the specialty, (3) the persistence of a large number of international medical graduates entering training programs, (4) a lack of ethnic and racial diversity in pediatricians compared with children, and (5) the persistence of marked regional variation in pediatrician supply. Supply models projecting the pediatric workforce are reviewed and generally indicate that the number of pediatricians per child will increase by 50% over the next 20 years. The differing methods of assessing workforce requirements are presented and critiqued. The report finds that the pediatric workforce is undergoing fundamental changes that will have important effects on the professional lives of pediatricians and children's health care delivery. (7/05)

PEDIATRICIAN WORKFORCE POLICY STATEMENT

Committee on Pediatric Workforce

ABSTRACT. This policy statement reviews important trends and other factors that affect the pediatrician workforce and the provision of pediatric health care, including changes in the pediatric patient population, pediatrician workforce, and nature of pediatric practice. The effect of these changes on pediatricians and the demand for pediatric care are discussed. The American Academy of Pediatrics (AAP) concludes that there is currently a shortage of pediatric medical subspecialists in many fields, as well as a shortage of pediatric surgical specialists. In addition, the AAP believes that the current distribution of primary care pediatricians is inadequate to meet the needs of children living in rural and other underserved areas, and more primary care pediatricians will be needed in the future because of the increasing number of children who have significant chronic health problems, changes in physician work hours, and implementation of current health reform efforts that seek to improve access to comprehensive patient- and family-centered care for all children in a medical home. The AAP is committed to being an active participant in physician workforce policy

development with both professional organizations and governmental bodies to ensure a pediatric perspective on health care workforce issues. The overall purpose of this statement is to summarize policy recommendations and serve as a resource for the AAP and other stakeholders as they address pediatrician workforce issues that ultimately influence the quality of pediatric health care provided to children in the United States. (7/13)

PEDIATRICIAN-FAMILY-PATIENT RELATIONSHIPS: MANAGING THE BOUNDARIES

Committee on Bioethics

ABSTRACT. All professionals are concerned about maintaining the appropriate limits in their relationships with those they serve. Pediatricians should be aware that, under normal circumstances, caring for one's own children presents significant ethical issues. Pediatricians also must strive to maintain appropriate professional boundaries in their relationships with the family members of their patients. Pediatricians should avoid behavior that patients and parents might misunderstand as having sexual or inappropriate social meaning. Romantic and sexual involvement between physicians and patients is unacceptable. The acceptance of gifts or nonmonetary compensation for medical services has the potential to affect the professional relationship adversely. (11/09, reaffirmed 1/14)

THE PEDIATRICIAN'S ROLE IN CHILD MALTREATMENT PREVENTION (CLINICAL REPORT)

Emalee G. Flaherty, MD; John Stirling, Jr, MD; and

Committee on Child Abuse and Neglect

ABSTRACT. It is the pediatrician's role to promote the child's well-being and to help parents raise healthy, well-adjusted children. Pediatricians, therefore, can play an important role in the prevention of child maltreatment. Previous clinical reports and policy statements from the American Academy of Pediatrics have focused on improving the identification and management of child maltreatment. This clinical report outlines how the pediatrician can help to strengthen families and promote safe, stable, nurturing relationships with the aim of preventing maltreatment. After describing some of the triggers and factors that place children at risk for maltreatment, the report describes how pediatricians can identify family strengths, recognize risk factors, provide helpful guidance, and refer families to programs and other resources with the goal of strengthening families, preventing child maltreatment, and enhancing child development. (9/10, reaffirmed 1/14)

THE PEDIATRICIAN'S ROLE IN COMMUNITY PEDIATRICS

Committee on Community Health Services

ABSTRACT. This policy statement reaffirms the pediatrician's role in community pediatrics. It offers pediatricians a definition of community pediatrics and provides a set of specific recommendations that underscore the critical nature of this important dimension of the profession. (4/05, reaffirmed 1/10)

THE PEDIATRICIAN'S ROLE IN DEVELOPMENT AND IMPLEMENTATION OF AN INDIVIDUAL EDUCATION PLAN (IEP) AND/OR AN INDIVIDUAL FAMILY SERVICE PLAN (IFSP)

Committee on Children With Disabilities

ABSTRACT. The Individual Education Plan and Individual Family Service Plan are legally mandated documents developed by a multidisciplinary team assessment that specifies goals and services for each child eligible for special educational services or early intervention services. Pediatricians need to be knowledgeable of federal, state, and local requirements; establish linkages with early intervention, educational professionals, and parent support groups; and collaborate with the team working with individual children. (7/99, reaffirmed 11/02, 1/06)

THE PEDIATRICIAN'S ROLE IN FAMILY SUPPORT AND FAMILY SUPPORT PROGRAMS

Committee on Early Childhood, Adoption, and Dependent Care

ABSTRACT. Children's social, emotional, and physical health; their developmental trajectory; and the neuro-circuits that are being created and reinforced in their developing brains are all directly influenced by their relationships during early childhood. The stresses associated with contemporary American life can challenge families' abilities to promote successful developmental outcomes and emotional health for their children. Pediatricians are positioned to serve as partners with families and other community providers in supporting the well-being of children and their families. The structure and support of families involve forces that are often outside the agenda of the usual pediatric health supervision visits. Pediatricians must ensure that their medical home efforts promote a holistically healthy family environment for all children. This statement recommends opportunities for pediatricians to develop their expertise in assessing the strengths and stresses in families, in counseling families about strategies and resources, and in collaborating with others in their communities to support family relationships. (11/11)

THE PEDIATRICIAN'S ROLE IN SUPPORTING ADOPTIVE FAMILIES (CLINICAL REPORT)

*Veronnie F. Jones, MD, PhD; Elaine E. Schulte, MD, MPH;
Committee on Early Childhood; and Council on Foster Care, Adoption, and Kinship Care*

ABSTRACT. Each year, more children join families through adoption. Pediatricians have an important role in assisting adoptive families in the various challenges they may face with respect to adoption. The acceptance of the differences between families formed through birth and those formed through adoption is essential in promoting positive emotional growth within the family. It is important for pediatricians to be aware of the adoptive parents' need to be supported in their communication with their adopted children. (9/12)

THE PEDIATRICIAN'S ROLE IN THE EVALUATION AND PREPARATION OF PEDIATRIC PATIENTS UNDERGOING ANESTHESIA

Section on Anesthesiology and Pain Medicine

ABSTRACT. Pediatricians play a key role in helping prepare patients and families for anesthesia and surgery. The questions to be answered by the pediatrician fall into 2 categories. The first involves preparation: is the patient in optimal medical condition for surgery, and are the patient and family emotionally and cognitively ready for surgery? The second category concerns logistics: what communication and organizational needs are necessary to enable safe passage through the perioperative process? This revised statement updates the recommendations for the pediatrician's role in the preoperative preparation of patients. (8/14)

See full text on page 889.

THE PEDIATRICIAN'S ROLE IN THE PREVENTION OF MISSING CHILDREN (CLINICAL REPORT)

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. In 2002, the *Second National Incidence Studies of Missing, Abducted, Runaway, and Thrownaway Children* report was released by the US Department of Justice, providing new data on a problem that our nation continues to face. This clinical report describes the categories of missing children, the prevalence of each, and prevention strategies that primary care pediatricians can share with parents to increase awareness and education about the safety of their children. (10/04)

PERSONAL WATERCRAFT USE BY CHILDREN AND ADOLESCENTS

Committee on Injury and Poison Prevention

ABSTRACT. The use of personal watercraft (PWC) has increased dramatically during the past decade as have the speed and mobility of the watercraft. A similar dramatic increase in PWC-related injury and death has occurred simultaneously. No one younger than 16 years should operate a PWC. The operator and all passengers must wear US Coast Guard-approved personal flotation devices. Other safety recommendations are suggested for parents and pediatricians. (2/00, reaffirmed 5/04, 1/07, 6/10)

PESTICIDE EXPOSURE IN CHILDREN

Council on Environmental Health

ABSTRACT. This statement presents the position of the American Academy of Pediatrics on pesticides. Pesticides are a collective term for chemicals intended to kill unwanted insects, plants, molds, and rodents. Children encounter pesticides daily and have unique susceptibilities to their potential toxicity. Acute poisoning risks are clear, and understanding of chronic health implications from both acute and chronic exposure are emerging. Epidemiologic evidence demonstrates associations between early life

exposure to pesticides and pediatric cancers, decreased cognitive function, and behavioral problems. Related animal toxicology studies provide supportive biological plausibility for these findings. Recognizing and reducing problematic exposures will require attention to current inadequacies in medical training, public health tracking, and regulatory action on pesticides. Ongoing research describing toxicologic vulnerabilities and exposure factors across the life span are needed to inform regulatory needs and appropriate interventions. Policies that promote integrated pest management, comprehensive pesticide labeling, and marketing practices that incorporate child health considerations will enhance safe use. (11/12)

PESTICIDE EXPOSURE IN CHILDREN (TECHNICAL REPORT)

James R. Roberts, MD, MPH; Catherine J. Karr, MD, PhD;
and Council on Environmental Health

ABSTRACT. Pesticides are a collective term for a wide array of chemicals intended to kill unwanted insects, plants, molds, and rodents. Food, water, and treatment in the home, yard, and school are all potential sources of children's exposure. Exposures to pesticides may be overt or subacute, and effects range from acute to chronic toxicity. In 2008, pesticides were the ninth most common substance reported to poison control centers, and approximately 45% of all reports of pesticide poisoning were for children. Organophosphate and carbamate poisoning are perhaps the most widely known acute poisoning syndromes, can be diagnosed by depressed red blood cell cholinesterase levels, and have available antidotal therapy. However, numerous other pesticides that may cause acute toxicity, such as pyrethroid and neonicotinoid insecticides, herbicides, fungicides, and rodenticides, also have specific toxic effects; recognition of these effects may help identify acute exposures. Evidence is increasingly emerging about chronic health implications from both acute and chronic exposure. A growing body of epidemiological evidence demonstrates associations between parental use of pesticides, particularly insecticides, with acute lymphocytic leukemia and brain tumors. Prenatal, household, and occupational exposures (maternal and paternal) appear to be the largest risks. Prospective cohort studies link early-life exposure to organophosphates and organochlorine pesticides (primarily DDT) with adverse effects on neurodevelopment and behavior. Among the findings associated with increased pesticide levels are poorer mental development by using the Bayley index and increased scores on measures assessing pervasive developmental disorder, inattention, and attention-deficit/hyperactivity disorder. Related animal toxicology studies provide supportive biological plausibility for these findings. Additional data suggest that there may also be an association between parental pesticide use and adverse birth outcomes including physical birth defects, low birth weight, and fetal death, although the data are less robust than for cancer and neurodevelopmental effects.

Children's exposures to pesticides should be limited as much as possible. (11/12)

PHOTOTHERAPY TO PREVENT SEVERE NEONATAL HYPERBILIRUBINEMIA IN THE NEWBORN INFANT 35 OR MORE WEEKS OF GESTATION (TECHNICAL REPORT)

Vinod K. Bhutani, MD, and Committee on Fetus and
Newborn

ABSTRACT. *Objective.* To standardize the use of phototherapy consistent with the American Academy of Pediatrics clinical practice guideline for the management of hyperbilirubinemia in the newborn infant 35 or more weeks of gestation.

Methods. Relevant literature was reviewed. Phototherapy devices currently marketed in the United States that incorporate fluorescent, halogen, fiber-optic, or blue light-emitting diode light sources were assessed in the laboratory.

Results. The efficacy of phototherapy units varies widely because of differences in light source and configuration. The following characteristics of a device contribute to its effectiveness: (1) emission of light in the blue-to-green range that overlaps the in vivo plasma bilirubin absorption spectrum (~460–490 nm); (2) irradiance of at least $30 \mu\text{W}\cdot\text{cm}^{-2}\cdot\text{nm}^{-1}$ (confirmed with an appropriate irradiance meter calibrated over the appropriate wavelength range); (3) illumination of maximal body surface; and (4) demonstration of a decrease in total bilirubin concentrations during the first 4 to 6 hours of exposure.

Recommendations. The intensity and spectral output of phototherapy devices is useful in predicting potential effectiveness in treating hyperbilirubinemia (group B recommendation). Clinical effectiveness should be evaluated before and monitored during use (group B recommendation). Blocking the light source or reducing exposed body surface should be avoided (group B recommendation). Standardization of irradiance meters, improvements in device design, and lower-upper limits of light intensity for phototherapy units merit further study. Comparing the in vivo performance of devices is not practical, in general, and alternative procedures need to be explored. (9/11, reaffirmed 7/14)

PHYSICIAN HEALTH AND WELLNESS (CLINICAL REPORT)

Hilary McClafferty, MD, FAAP; Oscar W. Brown, MD,
FAAP; Section on Integrative Medicine; and Committee on
Practice and Ambulatory Medicine

ABSTRACT. Physician health and wellness is a critical issue gaining national attention because of the high prevalence of physician burnout. Pediatricians and pediatric trainees experience burnout at levels equivalent to other medical specialties, highlighting a need for more effective efforts to promote health and well-being in the pediatric community. This report will provide an overview of physician burnout, an update on work in the field of preventive physician health and wellness, and a discussion of emerging initiatives that have potential to promote health at all levels of pediatric training.

Pediatricians are uniquely positioned to lead this movement nationally, in part because of the emphasis placed on wellness in the Pediatric Milestone Project, a joint collaboration between the Accreditation Council for Graduate Medical Education and the American Board of Pediatrics. Updated core competencies calling for a balanced approach to health, including focus on nutrition, exercise, mindfulness, and effective stress management, signal a paradigm shift and send the message that it is time for pediatricians to cultivate a culture of wellness better aligned with their responsibilities as role models and congruent with advances in pediatric training.

Rather than reviewing programs in place to address substance abuse and other serious conditions in distressed physicians, this article focuses on forward progress in the field, with an emphasis on the need for prevention and anticipation of predictable stressors related to burnout in medical training and practice. Examples of positive progress and several programs designed to promote physician health and wellness are reviewed. Areas where more research is needed are highlighted. (9/14)

See full text on page 899.

PHYSICIAN REFUSAL TO PROVIDE INFORMATION OR TREATMENT ON THE BASIS OF CLAIMS OF CONSCIENCE

Committee on Bioethics

ABSTRACT. Health care professionals may have moral objections to particular medical interventions. They may refuse to provide or cooperate in the provision of these interventions. Such objections are referred to as conscientious objections. Although it may be difficult to characterize or validate claims of conscience, respecting the individual physician's moral integrity is important. Conflicts arise when claims of conscience impede a patient's access to medical information or care. A physician's conscientious objection to certain interventions or treatments may be constrained in some situations. Physicians have a duty to disclose to prospective patients treatments they refuse to perform. As part of informed consent, physicians also have a duty to inform their patients of all relevant and legally available treatment options, including options to which they object. They have a moral obligation to refer patients to other health care professionals who are willing to provide those services when failing to do so would cause harm to the patient, and they have a duty to treat patients in emergencies when referral would significantly increase the probability of mortality or serious morbidity. Conversely, the health care system should make reasonable accommodations for physicians with conscientious objections. (11/09, reaffirmed 1/14)

PHYSICIANS' ROLES IN COORDINATING CARE OF HOSPITALIZED CHILDREN (CLINICAL REPORT)

Patricia S. Lye, MD; Committee on Hospital Care; and Section on Hospital Medicine

ABSTRACT. The care of hospitalized children and adolescents has become increasingly complex and often involves multiple physicians beyond the traditional primary care pediatrician. Hospitalists, medical subspecialists, surgical specialists, and hospital attending physicians may all participate in the care of hospitalized children and youth.

This report summarizes the responsibilities of the pediatrician and other involved physicians in ensuring that children receive coordinated and comprehensive medical care delivered within the context of their medical homes as inpatients, and that care is appropriately continued on an outpatient basis. (9/10)

PLANNED HOME BIRTH

Committee on Fetus and Newborn

ABSTRACT. The American Academy of Pediatrics concurs with the recent statement of the American College of Obstetricians and Gynecologists affirming that hospitals and birthing centers are the safest settings for birth in the United States while respecting the right of women to make a medically informed decision about delivery. This statement is intended to help pediatricians provide supportive, informed counsel to women considering home birth while retaining their role as child advocates and to summarize the standards of care for newborn infants born at home, which are consistent with standards for infants born in a medical care facility. Regardless of the circumstances of his or her birth, including location, every newborn infant deserves health care that adheres to the standards highlighted in this statement, more completely described in other publications from the American Academy of Pediatrics, including *Guidelines for Perinatal Care*. The goal of providing high-quality care to all newborn infants can best be achieved through continuing efforts by all participating health care providers and institutions to develop and sustain communications and understanding on the basis of professional interaction and mutual respect throughout the health care system. (4/13)

POLIOVIRUS

Committee on Infectious Diseases

ABSTRACT. Despite marked progress in global polio eradication, the threat of polio importation into the United States remains; therefore, all children should be protected against the disease. The standard schedule for poliovirus immunization remains 4 doses of inactivated poliovirus vaccine at 2, 4, and 6 through 18 months and 4 through 6 years of age. The minimum interval between doses 1 and 2 and between doses 2 and 3 is 4 weeks, and the minimum interval between doses 3 and 4 is 6 months. The minimum age for dose 1 is 6 weeks. Minimal age and intervals should be used when there is imminent threat of exposure, such as travel to an area in which polio is endemic or epidemic. The final dose in the inactivated poliovirus vaccine series should be administered at 4 through 6 years of age, regardless of the previous number of doses administered before the fourth birthday, and at least 6 months since the last dose was received. (9/11)

POSTDISCHARGE FOLLOW-UP OF INFANTS WITH CONGENITAL DIAPHRAGMATIC HERNIA (CLINICAL REPORT)

Section on Surgery and Committee on Fetus and Newborn

ABSTRACT. Infants with congenital diaphragmatic hernia often require intensive treatment after birth, have prolonged hospitalizations, and have other congenital anomalies. After discharge from the hospital, they may have long-term sequelae such as respiratory insufficiency,

gastroesophageal reflux, poor growth, neurodevelopmental delay, behavior problems, hearing loss, hernia recurrence, and orthopedic deformities. Structured follow-up for these patients facilitates early recognition and treatment of these complications. In this report, follow-up of infants with congenital diaphragmatic hernia is outlined. (3/08, reaffirmed 5/11)

POSTEXPOSURE PROPHYLAXIS IN CHILDREN AND ADOLESCENTS FOR NONOCCUPATIONAL EXPOSURE TO HUMAN IMMUNODEFICIENCY VIRUS (CLINICAL REPORT)

Committee on Pediatric AIDS

ABSTRACT. Exposure to human immunodeficiency virus (HIV) can occur in a number of situations unique to, or more common among, children and adolescents. Guidelines for postexposure prophylaxis (PEP) for occupational and nonoccupational (eg, sexual, needle-sharing) exposures to HIV have been published by the US Public Health Service, but they do not directly address nonoccupational HIV exposures unique to children (such as accidental exposure to human milk from a woman infected with HIV or a puncture wound from a discarded needle on a playground), and they do not provide antiretroviral drug information relevant to PEP in children.

This clinical report reviews issues of potential exposure of children and adolescents to HIV and gives recommendations for PEP in those situations. The risk of HIV transmission from nonoccupational, nonperinatal exposure is generally low. Transmission risk is modified by factors related to the source and extent of exposure. Determination of the HIV infection status of the exposure source may not be possible, and data on transmission risk by exposure type may not exist. Except in the setting of perinatal transmission, no studies have demonstrated the safety and efficacy of postexposure use of antiretroviral drugs for the prevention of HIV transmission in nonoccupational settings. Antiretroviral therapy used for PEP is associated with significant toxicity. The decision to initiate prophylaxis needs to be made in consultation with the patient, the family, and a clinician with experience in treatment of persons with HIV infection. If instituted, therapy should be started as soon as possible after an exposure—no later than 72 hours—and continued for 28 days. Many clinicians would use 3 drugs for PEP regimens, although 2 drugs may be considered in certain circumstances. Instruction for avoiding secondary transmission should be given. Careful follow-up is needed for psychologic support, encouragement of medication adherence, toxicity monitoring, and serial HIV antibody testing. (6/03, reaffirmed 1/07, 10/08)

POSTNATAL CORTICOSTEROIDS TO PREVENT OR TREAT BRONCHOPULMONARY DYSPLASIA

Kristi L. Watterberg, MD, and Committee on Fetus and Newborn

ABSTRACT. The purpose of this revised statement is to review current information on the use of postnatal glucocorticoids to prevent or treat bronchopulmonary dysplasia in the preterm infant and to make updated recommendations regarding their use. High-dose dexamethasone (0.5 mg/kg per day) does not seem to confer

additional therapeutic benefit over lower doses and is not recommended. Evidence is insufficient to make a recommendation regarding other glucocorticoid doses and preparations. The clinician must use clinical judgment when attempting to balance the potential adverse effects of glucocorticoid treatment with those of bronchopulmonary dysplasia. (9/10, reaffirmed 1/14)

POSTNATAL GLUCOSE HOMEOSTASIS IN LATE-PRETERM AND TERM INFANTS (CLINICAL REPORT)

David H. Adamkin, MD, and Committee on Fetus and Newborn

ABSTRACT. This report provides a practical guide and algorithm for the screening and subsequent management of neonatal hypoglycemia. Current evidence does not support a specific concentration of glucose that can discriminate normal from abnormal or can potentially result in acute or chronic irreversible neurologic damage. Early identification of the at-risk infant and institution of prophylactic measures to prevent neonatal hypoglycemia are recommended as a pragmatic approach despite the absence of a consistent definition of hypoglycemia in the literature. (3/11)

PRECERTIFICATION PROCESS

Committee on Hospital Care

ABSTRACT. Precertification is a process still used by health insurance companies to control health care costs. Although we believe precertification is unnecessary and not cost-effective, in those instances where precertification is still being utilized, we suggest that the following procedures be adopted. This statement suggests guidelines that should help achieve this goal while allowing optimal access to care for children. (8/00, reaffirmed 5/05, 11/08)

PREMEDICATION FOR NONEMERGENCY ENDOTRACHEAL INTUBATION IN THE NEONATE (CLINICAL REPORT)

Praveen Kumar, MD; Susan E. Denson, MD; Thomas J. Mancuso, MD; Committee on Fetus and Newborn; and Section on Anesthesiology and Pain Medicine

ABSTRACT. Endotracheal intubation is a common procedure in newborn care. The purpose of this clinical report is to review currently available evidence on use of premedication for intubation, identify gaps in knowledge, and provide guidance for making decisions about the use of premedication. (2/10, reaffirmed 8/13)

PRENATAL SUBSTANCE ABUSE: SHORT- AND LONG-TERM EFFECTS ON THE EXPOSED FETUS (TECHNICAL REPORT)

Marylou Behnke, MD; Vincent C. Smith, MD; Committee on Substance Abuse; and Committee on Fetus and Newborn

ABSTRACT. Prenatal substance abuse continues to be a significant problem in this country and poses important health risks for the developing fetus. The primary care pediatrician's role in addressing prenatal substance exposure includes prevention, identification of exposure, recognition of medical issues for the exposed newborn infant, protection of the infant, and follow-up of the exposed infant. This report will provide information for the most common drugs involved in prenatal exposure: nicotine,

alcohol, marijuana, opiates, cocaine, and methamphetamine. (2/13)

THE PRENATAL VISIT (CLINICAL REPORT)

George J. Cohen, MD, and Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. As advocates for children and their families, pediatricians can support and guide expectant parents in the prenatal period. Prenatal visits allow the pediatrician to gather basic information from expectant parents, offer them information and advice, and identify high-risk conditions that may require special care. In addition, a prenatal visit is the first step in establishing a relationship between the family and the pediatrician (the infant's medical home) and in helping the parents develop parenting skills and confidence. There are several possible formats for this first visit. The one used depends on the experience and preference of the parents, the style of the pediatrician's practice, and pragmatic issues of reimbursement. (9/09, reaffirmed 5/14)

PREPARATION FOR EMERGENCIES IN THE OFFICES OF PEDIATRICIANS AND PEDIATRIC PRIMARY CARE PROVIDERS

Committee on Pediatric Emergency Medicine

ABSTRACT. High-quality pediatric emergency care can be provided only through the collaborative efforts of many health care professionals and child advocates working together throughout a continuum of care that extends from prevention and the medical home to prehospital care, to emergency department stabilization, to critical care and rehabilitation, and finally to a return to care in the medical home. At times, the office of the pediatric primary care provider will serve as the entry site into the emergency care system, which comprises out-of-hospital emergency medical services personnel, emergency department nurses and physicians, and other emergency and critical care providers. Recognizing the important role of pediatric primary care providers in the emergency care system for children and understanding the capabilities and limitations of that system are essential if pediatric primary care providers are to offer the best chance at intact survival for every child who is brought to the office with an emergency. Optimizing pediatric primary care provider office readiness for emergencies requires consideration of the unique aspects of each office practice, the types of patients and emergencies that might be seen, the resources on site, and the resources of the larger emergency care system of which the pediatric primary care provider's office is a part. Parent education regarding prevention, recognition, and response to emergencies, patient triage, early recognition and stabilization of pediatric emergencies in the office, and timely transfer to an appropriate facility for definitive care are important responsibilities of every pediatric primary care provider. In addition, pediatric primary care providers can collaborate with out-of-hospital and hospital-based providers and advocate for the best-quality emergency care for their patients. (7/07, reaffirmed 6/11)

PREPARING FOR PEDIATRIC EMERGENCIES: DRUGS TO CONSIDER (CLINICAL REPORT)

Mary A. Hegenbarth, MD, and Committee on Drugs

ABSTRACT. This clinical report provides current recommendations regarding the selection and use of drugs in preparation for pediatric emergencies. It is not intended to be a comprehensive list of all medications that may be used in all emergencies. When possible, dosage recommendations are consistent with those used in current emergency references such as the *Advanced Pediatric Life Support* and *Pediatric Advanced Life Support* textbooks and the recently revised American Heart Association resuscitation guidelines. (2/08, reaffirmed 10/11)

PRESCRIBING ASSISTIVE-TECHNOLOGY SYSTEMS: FOCUS ON CHILDREN WITH IMPAIRED COMMUNICATION (CLINICAL REPORT)

Larry W. Desch, MD; Deborah Gaebler-Spira, MD; and Council on Children With Disabilities

ABSTRACT. This clinical report defines common terms of use and provides information on current practice, research, and limitations of assistive technology that can be used in systems for communication. The assessment process to determine the best devices for use with a particular child (ie, the best fit of a device) is also reviewed. The primary care pediatrician, as part of the medical home, plays an important role in the interdisciplinary effort to provide appropriate assistive technology and may be asked to make a referral for assessment or prescribe a particular device. This report provides resources to assist pediatricians in this role and reviews the interdisciplinary team functional evaluation using standardized assessments; the multiple funding opportunities available for obtaining devices and ways in which pediatricians can assist families with obtaining them; the training necessary to use these systems once the devices are procured; the follow-up evaluation to ensure that the systems are meeting their goals; and the leadership skills needed to advocate for this technology. The American Academy of Pediatrics acknowledges the need for key resources to be identified in the community and recognizes that these resources are a shared medical, educational, therapeutic, and family responsibility. Although this report primarily deals with assistive technology specific for communication impairments, many of the details in this report also can aid in the acquisition and use of other types of assistive technology. (6/08, reaffirmed 1/12)

PRESCRIBING THERAPY SERVICES FOR CHILDREN WITH MOTOR DISABILITIES (CLINICAL REPORT)

Committee on Children With Disabilities

ABSTRACT. Pediatricians often are called on to prescribe physical, occupational, and speech-language therapy services for children with motor disabilities. This report defines the context in which rehabilitation therapies should be prescribed, emphasizing the evaluation and enhancement of the child's function and abilities and participation in age-appropriate life roles. The report encourages pediatricians to work with teams including the parents, child, teachers, therapists, and other physicians to ensure that their patients receive appropriate therapy services. (6/04, reaffirmed 5/07, 5/11)

PRESERVATION OF FERTILITY IN PEDIATRIC AND ADOLESCENT PATIENTS WITH CANCER (TECHNICAL REPORT)

Mary E. Fallat, MD; John Hutter, MD; Committee on Bioethics; Section on Hematology/Oncology; and Section on Surgery

ABSTRACT. Many cancers that present in children and adolescents are curable with surgery, chemotherapy, and/or radiation therapy. Potential adverse consequences of treatment include sterility, infertility, or subfertility as a result of either gonad removal or damage to germ cells from adjuvant therapy. In recent years, treatment of solid tumors and hematologic malignancies has been modified in an attempt to reduce damage to the gonads. Simultaneously, advances in assisted reproductive techniques have led to new possibilities for the prevention and treatment of infertility. This technical report reviews the topic of fertility preservation in pediatric and adolescent patients with cancer, including ethical considerations. (5/08, reaffirmed 2/12)

PREVENTING AND TREATING HOMESICKNESS (CLINICAL REPORT)

Christopher A. Thurber, PhD; Edward Walton, MD; and Council on School Health

ABSTRACT. Homesickness is the distress and functional impairment caused by an actual or anticipated separation from home and attachment objects such as parents. It is characterized by acute longing and preoccupying thoughts of home. Almost all children, adolescents, and adults experience some degree of homesickness when they are apart from familiar people and environments. Pediatricians and other health care professionals are in a unique position to assist families in understanding the etiology, prevention, and treatment of homesickness. In the case of planned separations, such as summer camp, techniques are provided that may aid in prevention. In the case of unanticipated or traumatic separations, such as hospitalization, effective treatment strategies are available. (1/07, reaffirmed 5/12)

PREVENTION AND MANAGEMENT OF PAIN IN THE NEONATE: AN UPDATE

Committee on Fetus and Newborn and Section on Surgery (joint with Canadian Paediatric Society)

ABSTRACT. The prevention of pain in neonates should be the goal of all caregivers, because repeated painful exposures have the potential for deleterious consequences. Neonates at greatest risk of neurodevelopmental impairment as a result of preterm birth (ie, the smallest and sickest) are also those most likely to be exposed to the greatest number of painful stimuli in the NICU. Although there are major gaps in our knowledge regarding the most effective way to prevent and relieve pain in neonates, proven and safe therapies are currently underused for routine minor yet painful procedures. Every health care facility caring for neonates should implement an effective pain-prevention program, which includes strategies for routinely assessing pain, minimizing the number of painful procedures performed, effectively using pharmacologic and nonpharmacologic therapies for the prevention of pain associated with routine minor procedures, and

eliminating pain associated with surgery and other major procedures. (11/06, reaffirmed 5/10)

PREVENTION AND MANAGEMENT OF POSITIONAL SKULL DEFORMITIES IN INFANTS (CLINICAL REPORT)

James Laughlin, MD; Thomas G. Luerksen, MD; Mark S. Dias, MD; Committee on Practice and Ambulatory Medicine; and Section on Neurological Surgery

ABSTRACT. Positional skull deformities may be present at birth or may develop during the first few months of life. Since the early 1990s, US pediatricians have seen an increase in the number of children with cranial asymmetry, particularly unilateral flattening of the occiput, likely attributable to parents following the American Academy of Pediatrics "Back to Sleep" positioning recommendations aimed at decreasing the risk of sudden infant death syndrome. Positional skull deformities are generally benign, reversible head-shape anomalies that do not require surgical intervention, as opposed to craniosynostosis, which can result in neurologic damage and progressive craniofacial distortion. Although associated with some risk of positional skull deformity, healthy young infants should be placed down for sleep on their backs. The practice of putting infants to sleep on their backs has been associated with a drastic decrease in the incidence of sudden infant death syndrome. Pediatricians need to be able to properly differentiate infants with benign skull deformities from those with craniosynostosis, educate parents on methods of proactively decreasing the likelihood of the development of occipital flattening, initiate appropriate management, and make referrals when necessary. This report provides guidance for the prevention, diagnosis, and management of positional skull deformity in an otherwise normal infant without evidence of associated anomalies, syndromes, or spinal disease. (11/11)

PREVENTION AND TREATMENT OF TYPE 2 DIABETES MELLITUS IN CHILDREN, WITH SPECIAL EMPHASIS ON AMERICAN INDIAN AND ALASKA NATIVE CHILDREN (CLINICAL REPORT)

Committee on Native American Child Health and Section on Endocrinology

ABSTRACT. The emergence of type 2 diabetes mellitus in the American Indian/Alaska Native pediatric population presents a new challenge for pediatricians and other health care professionals. This chronic disease requires preventive efforts, early diagnosis, and collaborative care of the patient and family within the context of a medical home. (10/03, reaffirmed 10/08)

PREVENTION OF AGRICULTURAL INJURIES AMONG CHILDREN AND ADOLESCENTS

Committee on Injury and Poison Prevention and Committee on Community Health Services

ABSTRACT. Although the annual number of farm deaths to children and adolescents has decreased since publication of the 1988 American Academy of Pediatrics statement, "Rural Injuries," the rate of nonfatal farm injuries has increased. Approximately 100 unintentional injury deaths occur annually to children and adolescents on US farms, and an additional 22 000 injuries to children younger than 20 years occur on farms. Relatively

few adolescents are employed on farms compared with other types of industry, yet the proportion of fatalities in agriculture is higher than that for any other type of adolescent employment. The high mortality and severe morbidity associated with farm injuries require continuing and improved injury-control strategies. This statement provides recommendations for pediatricians regarding patient and community education as well as public advocacy related to agricultural injury prevention in childhood and adolescence. (10/01, reaffirmed 1/07, 11/11)

PREVENTION OF CHOKING AMONG CHILDREN

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Choking is a leading cause of morbidity and mortality among children, especially those aged 3 years or younger. Food, coins, and toys are the primary causes of choking-related injury and death. Certain characteristics, including shape, size, and consistency, of certain toys and foods increase their potential to cause choking among children. Childhood choking hazards should be addressed through comprehensive and coordinated prevention activities. The US Consumer Product Safety Commission (CPSC) should increase efforts to ensure that toys that are sold in retail store bins, vending machines, or on the Internet have appropriate choking-hazard warnings; work with manufacturers to improve the effectiveness of recalls of products that pose a choking risk to children; and increase efforts to prevent the resale of these recalled products via online auction sites. Current gaps in choking-prevention standards for children's toys should be reevaluated and addressed, as appropriate, via revisions to the standards established under the Child Safety Protection Act, the Consumer Product Safety Improvement Act, or regulation by the CPSC. Prevention of food-related choking among children in the United States has been inadequately addressed at the federal level. The US Food and Drug Administration should establish a systematic, institutionalized process for examining and addressing the hazards of food-related choking. This process should include the establishment of the necessary surveillance, hazard evaluation, enforcement, and public education activities to prevent food-related choking among children. While maintaining its highly cooperative arrangements with the CPSC and the US Department of Agriculture, the Food and Drug Administration should have the authority to address choking-related risks of all food products, including meat products that fall under the jurisdiction of the US Department of Agriculture. The existing National Electronic Injury Surveillance System–All Injury Program of the CPSC should be modified to conduct more-detailed surveillance of choking on food among children. Food manufacturers should design new foods and redesign existing foods to avoid shapes, sizes, textures, and other characteristics that increase choking risk to children, to the extent possible. Pediatricians, dentists, and other infant and child health care providers should provide choking-prevention counseling to parents as an integral part of anticipatory guidance activities. (2/10)

PREVENTION OF DROWNING

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Drowning is a leading cause of injury-related death in children. In 2006, fatal drowning claimed the lives of approximately 1100 US children younger than 20 years. A number of strategies are available to prevent these tragedies. As educators and advocates, pediatricians can play an important role in the prevention of drowning. (5/10)

PREVENTION OF DROWNING (TECHNICAL REPORT)

Committee on Injury, Violence, and Poison Prevention and

Jeffrey Weiss, MD

ABSTRACT. Drowning is a leading cause of injury-related death in children. In 2006, approximately 1100 US children younger than 20 years died from drowning. A number of strategies are available to prevent these tragedies. As educators and advocates, pediatricians can play an important role in the prevention of drowning. (5/10)

PREVENTION OF PEDIATRIC OVERWEIGHT AND OBESITY

Committee on Nutrition

ABSTRACT. The dramatic increase in the prevalence of childhood overweight and its resultant comorbidities are associated with significant health and financial burdens, warranting strong and comprehensive prevention efforts. This statement proposes strategies for early identification of excessive weight gain by using body mass index, for dietary and physical activity interventions during health supervision encounters, and for advocacy and research. (8/03, reaffirmed 10/06)

PREVENTION OF ROTAVIRUS DISEASE: UPDATED GUIDELINES FOR USE OF ROTAVIRUS VACCINE

Committee on Infectious Diseases

ABSTRACT. This statement updates and replaces the 2007 American Academy of Pediatrics statement for prevention of rotavirus gastroenteritis. In February 2006, a live oral human-bovine reassortant rotavirus vaccine (RV5 [RotaTeq]) was licensed as a 3-dose series for use in infants in the United States. The American Academy of Pediatrics recommended routine use of RV5 in infants in the United States. In April 2008, a live, oral, human attenuated rotavirus vaccine (RV1 [Rotarix]) was licensed as a 2-dose series for use in infants in the United States. The American Academy of Pediatrics recommends routine immunization of infants in the United States with rotavirus vaccine. The American Academy of Pediatrics does not express a preference for either RV5 or RV1. RV5 is to be administered orally in a 3-dose series with doses administered at 2, 4, and 6 months of age; RV1 is to be administered orally in a 2-dose series with doses administered at 2 and 4 months of age. The first dose of rotavirus vaccine should be administered from 6 weeks through 14 weeks, 6 days of age. The minimum interval between doses of rotavirus vaccine is 4 weeks. All doses should be administered by 8 months, 0 days of age. Recommendations in this statement also address the maximum ages for doses, contraindications, precautions, and special situations for administration of rotavirus vaccine. (3/09)

PREVENTION OF SEXUAL HARASSMENT IN THE WORKPLACE AND EDUCATIONAL SETTINGS

Committee on Pediatric Workforce

ABSTRACT. The American Academy of Pediatrics is committed to working to ensure that workplaces and educational settings in which pediatricians spend time are free of sexual harassment. The purpose of this statement is to heighten awareness and sensitivity to this important issue, recognizing that institutions, clinics, and office-based practices may have existing policies. (10/06, reaffirmed 5/09, 1/12)

THE PREVENTION OF UNINTENTIONAL INJURY AMONG AMERICAN INDIAN AND ALASKA NATIVE CHILDREN: A SUBJECT REVIEW (CLINICAL REPORT)

Committee on Native American Child Health and Committee on Injury and Poison Prevention

ABSTRACT. Among ethnic groups in the United States, American Indian and Alaska Native (AI/AN) children experience the highest rates of injury mortality and morbidity. Injury mortality rates for AI/AN children have decreased during the past quarter century, but remain almost double the rate for all children in the United States. The Indian Health Service (IHS), the federal agency with the primary responsibility for the health care of AI/AN people, has sponsored an internationally recognized injury prevention program designed to reduce the risk of injury death by addressing community-specific risk factors. Model programs developed by the IHS and tribal governments have led to successful outcomes in motor vehicle occupant safety, drowning prevention, and fire safety. Injury prevention programs in tribal communities require special attention to the sovereignty of tribal governments and the unique cultural aspects of health care and communication. Pediatricians working with AI/AN children on reservations or in urban environments are strongly urged to collaborate with tribes and the IHS to create community-based coalitions and develop programs to address highly preventable injury-related mortality and morbidity. Strong advocacy also is needed to promote childhood injury prevention as an important priority for federal agencies and tribes. (12/99, reaffirmed 12/02 COIVPP, 5/03 CONACH, 1/06, 1/09)

PREVENTION OF VARICELLA: UPDATE OF RECOMMENDATIONS FOR USE OF QUADRIVALENT AND MONOVALENT VARICELLA VACCINES IN CHILDREN

Committee on Infectious Diseases

ABSTRACT. Two varicella-containing vaccines are licensed for use in the United States: monovalent varicella vaccine (Varivax [Merck & Co, Inc, West Point, PA]) and quadrivalent measles-mumps-rubella-varicella vaccine (MMRV) (ProQuad [Merck & Co, Inc]). It is estimated from postlicensure data that after vaccination at 12 through 23 months of age, 7 to 9 febrile seizures occur per 10 000 children who receive the MMRV, and 3 to 4 febrile seizures occur per 10 000 children who receive the measles-mumps-rubella (MMR) and varicella vaccines administered concurrently but at separate sites. Thus, 1 additional febrile seizure is expected to occur per approximately 2300 to 2600 children 12 to 23 months old vaccinated with the MMRV, when compared with separate MMR and varicella vaccine administration. The period

of risk for febrile seizures is from 5 through 12 days after receipt of the vaccine(s). No increased risk of febrile seizures is seen among patients 4 to 6 years of age receiving MMRV. Febrile seizures do not predispose to epilepsy or neurodevelopmental delays later in life and are not associated with long-term health impairment. The American Academy of Pediatrics recommends that either MMR and varicella vaccines separately or the MMRV be used for the first dose of measles, mumps, rubella, and varicella vaccines administered at 12 through 47 months of age. For the first dose of measles, mumps, rubella, and varicella vaccines administered at ages 48 months and older, and for dose 2 at any age (15 months to 12 years), use of MMRV generally is preferred over separate injections of MMR and varicella vaccines. (8/11)

PREVENTIVE ORAL HEALTH INTERVENTION FOR PEDIATRICIANS

Section on Pediatric Dentistry and Oral Health

ABSTRACT. This policy is a compilation of current concepts and scientific evidence required to understand and implement practice-based preventive oral health programs designed to improve oral health outcomes for all children and especially children at significant risk of dental decay. In addition, it reviews cariology and caries risk assessment and defines, through available evidence, appropriate recommendations for preventive oral health intervention by primary care pediatric practitioners. (12/08)

PRINCIPLES FOR THE DEVELOPMENT AND USE OF QUALITY MEASURES

Steering Committee on Quality Improvement and Management and Committee on Practice and Ambulatory Medicine

ABSTRACT. The American Academy of Pediatrics and its members are committed to improving the health care system to provide the highest-quality and safest health care for infants, children, adolescents, and young adults. This statement is intended as a guide for pediatricians and pediatric leadership on the appropriate uses of quality measures and the criteria on which they should be based. The statement summarizes the current national efforts on quality measurement and provides a set of principles for the development, use, and evaluation of quality measures for improving children's health and health care. The American Academy of Pediatrics recommends that these measures address important issues for children; be appropriate for children's health and health care, scientifically valid, and feasible; and focus on what can be improved. In addition, the American Academy of Pediatrics supports reasonable principles for the oversight and implementation of pay-for-performance programs. (2/08)

PRINCIPLES OF HEALTH CARE FINANCING

Committee on Child Health Financing

ABSTRACT. The American Academy of Pediatrics advocates that all children must have health insurance coverage that ensures them access to affordable and comprehensive quality care. Access to care depends on the design and implementation of payment systems that ensure the economic viability of the medical home; support and grow the professional pediatric workforce; promote the adoption

and implementation of health information technology; enhance medical education, training, and research; and encourage and reward quality-improvement programs that advance and strengthen the medical home. Health insurance plans must be portable from state to state, with administrative procedures to eliminate breaks and gaps in coverage to ensure continuous coverage from year to year. Plans should ensure free choice of clinicians and foster coordination with public and private community-based programs for infants, children, and adolescents through the age of 26. The scope of services provided by all health plans must include preventive, acute and chronic illness, behavioral, inpatient, emergency, and home health care. These plans must be affordable and have cost-sharing policies that protect patients and families from financial strain and are without risk of loss of benefits because of plan design, current illness, or preexisting condition. (10/10, reaffirmed 4/13)

PRINCIPLES OF JUDICIOUS ANTIBIOTIC PRESCRIBING FOR UPPER RESPIRATORY TRACT INFECTIONS IN PEDIATRICS (CLINICAL REPORT)

Committee on Infectious Diseases

ABSTRACT. Most upper respiratory tract infections are caused by viruses and require no antibiotics. This clinical report focuses on antibiotic prescribing strategies for bacterial upper respiratory tract infections, including acute otitis media, acute bacterial sinusitis, and streptococcal pharyngitis. The principles for judicious antibiotic prescribing that are outlined focus on applying stringent diagnostic criteria, weighing the benefits and harms of antibiotic therapy, and understanding situations when antibiotics may not be indicated. The principles can be used to amplify messages from recent clinical guidelines for local guideline development and for patient communication; they are broadly applicable to antibiotic prescribing in general. (11/13)

PRINCIPLES OF PEDIATRIC PATIENT SAFETY: REDUCING HARM DUE TO MEDICAL CARE

Steering Committee on Quality Improvement and Management and Committee on Hospital Care

ABSTRACT. Pediatricians are rendering care in an environment that is increasingly complex, which results in multiple opportunities to cause unintended harm. National awareness of patient safety risks has grown in the 10 years since the Institute of Medicine published its report *To Err Is Human*, and patients and society as a whole continue to challenge health care providers to examine their practices and implement safety solutions. The depth and breadth of harm incurred by the practice of medicine is still being defined as reports continue to uncover a variety of avoidable errors, from those that involve specific high-risk medications to those that are more generalizable, such as patient misidentification. Pediatricians in all venues must have a working knowledge of patient-safety language, advocate for best practices that attend to risks that are unique to children, identify and support a culture of safety, and lead efforts to eliminate avoidable harm in any setting in which medical care is rendered to children. (5/11)

PROBIOTICS AND PREBIOTICS IN PEDIATRICS (CLINICAL REPORT)

Dan W. Thomas, MD; Frank R. Greer, MD; Committee on Nutrition; and Section on Gastroenterology, Hepatology, and Nutrition

ABSTRACT. This clinical report reviews the currently known health benefits of probiotic and prebiotic products, including those added to commercially available infant formula and other food products for use in children. Probiotics are supplements or foods that contain viable microorganisms that cause alterations of the microflora of the host. Use of probiotics has been shown to be modestly effective in randomized clinical trials (RCTs) in (1) treating acute viral gastroenteritis in healthy children; and (2) preventing antibiotic-associated diarrhea in healthy children. There is some evidence that probiotics prevent necrotizing enterocolitis in very low birth weight infants (birth weight between 1000 and 1500 g), but more studies are needed. The results of RCTs in which probiotics were used to treat childhood *Helicobacter pylori* gastritis, irritable bowel syndrome, chronic ulcerative colitis, and infantile colic, as well as in preventing childhood atopy, although encouraging, are preliminary and require further confirmation. Probiotics have not been proven to be beneficial in treating or preventing human cancers or in treating children with Crohn disease. There are also safety concerns with the use of probiotics in infants and children who are immunocompromised, chronically debilitated, or seriously ill with indwelling medical devices.

Prebiotics are supplements or foods that contain a non-digestible food ingredient that selectively stimulates the favorable growth and/or activity of indigenous probiotic bacteria. Human milk contains substantial quantities of prebiotics. There is a paucity of RCTs examining prebiotics in children, although there may be some long-term benefit of prebiotics for the prevention of atopic eczema and common infections in healthy infants. Confirmatory well-designed clinical research studies are necessary. (11/10)

PROFESSIONAL LIABILITY INSURANCE AND MEDICOLEGAL EDUCATION FOR PEDIATRIC RESIDENTS AND FELLOWS

Committee on Medical Liability and Risk Management

ABSTRACT. The American Academy of Pediatrics believes that pediatric residents and fellows should be fully informed of the scope and limitations of their professional liability insurance coverage while in training. The academy states that residents and fellows should be educated by their training institutions on matters relating to medical liability and the importance of maintaining adequate and continuous professional liability insurance coverage throughout their careers in medicine. (8/11)

PROFESSIONALISM IN PEDIATRICS: STATEMENT OF PRINCIPLES

Committee on Bioethics

ABSTRACT. The purpose of this statement is to delineate the concept of professionalism within the context of pediatrics and to provide a brief statement of principles to guide the behavior and professional practice of pediatricians. (10/07, reaffirmed 5/11)

PROFESSIONALISM IN PEDIATRICS (TECHNICAL REPORT)

Mary E. Fallat, MD; Jacqueline Glover, PhD; and Committee on Bioethics

ABSTRACT. The purpose of this report is to provide a concrete overview of the ideal standards of behavior and professional practice to which pediatricians should aspire and by which students and residents can be evaluated. Recognizing that the ideal is not always achievable in the practical sense, this document details the key components of professionalism in pediatric practice with an emphasis on core professional values for which pediatricians should strive and that will serve as a moral compass needed to provide quality care for children and their families. (10/07, reaffirmed 5/11)

PROMOTING EDUCATION, MENTORSHIP, AND SUPPORT FOR PEDIATRIC RESEARCH

Committee on Pediatric Research

ABSTRACT. Pediatricians play a key role in advancing child health research to best attain and improve the physical, mental, and social health and well-being of all infants, children, adolescents, and young adults. Child health presents unique issues that require investigators who specialize in pediatric research. In addition, the scope of the pediatric research enterprise is transdisciplinary and includes the full spectrum of basic science, translational, community-based, health services, and child health policy research. Although most pediatricians do not directly engage in research, knowledge of research methodologies and approaches promotes critical evaluation of scientific literature, the practice of evidence-based medicine, and advocacy for evidence-based child health policy. This statement includes specific recommendations to promote further research education and support at all levels of pediatric training, from premedical to continuing medical education, as well as recommendations to increase support and mentorship for research activities. Pediatric research is crucial to the American Academy of Pediatrics' goal of improving the health of all children. The American Academy of Pediatrics continues to promote and encourage efforts to facilitate the creation of new knowledge and ways to reduce barriers experienced by trainees, practitioners, and academic faculty pursuing research. (4/14)

PROMOTING THE PARTICIPATION OF CHILDREN WITH DISABILITIES IN SPORTS, RECREATION, AND PHYSICAL ACTIVITIES (CLINICAL REPORT)

Nancy A. Murphy, MD; Paul S. Carbone, MD; and Council on Children With Disabilities

ABSTRACT. The benefits of physical activity are universal for all children, including those with disabilities. The participation of children with disabilities in sports and recreational activities promotes inclusion, minimizes deconditioning, optimizes physical functioning, and enhances overall well-being. Despite these benefits, children with disabilities are more restricted in their participation, have lower levels of fitness, and have higher levels of obesity than their peers without disabilities. Pediatricians and parents may overestimate the risks or overlook the benefits of physical activity in children with disabilities. Well-informed decisions regarding each child's partici-

pation must consider overall health status, individual activity preferences, safety precautions, and availability of appropriate programs and equipment. Health supervision visits afford pediatricians, children with disabilities, and parents opportunities to collaboratively generate goal-directed activity "prescriptions." Child, family, financial, and societal barriers to participation need to be directly identified and addressed in the context of local, state, and federal laws. The goal is inclusion for all children with disabilities in appropriate activities. This clinical report discusses the importance of physical activity, recreation, and sports participation for children with disabilities and offers practical suggestions to pediatric health care professionals for the promotion of participation. (5/08, reaffirmed 1/12)

PROMOTING THE WELL-BEING OF CHILDREN WHOSE PARENTS ARE GAY OR LESBIAN

Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. To promote optimal health and well-being of all children, the American Academy of Pediatrics (AAP) supports access for all children to (1) civil marriage rights for their parents and (2) willing and capable foster and adoptive parents, regardless of the parents' sexual orientation. The AAP has always been an advocate for, and has developed policies to support, the optimal physical, mental, and social health and well-being of all infants, children, adolescents, and young adults. In so doing, the AAP has supported families in all their diversity, because the family has always been the basic social unit in which children develop the supporting and nurturing relationships with adults that they need to thrive. Children may be born to, adopted by, or cared for temporarily by married couples, nonmarried couples, single parents, grandparents, or legal guardians, and any of these may be heterosexual, gay or lesbian, or of another orientation. Children need secure and enduring relationships with committed and nurturing adults to enhance their life experiences for optimal social-emotional and cognitive development. Scientific evidence affirms that children have similar developmental and emotional needs and receive similar parenting whether they are raised by parents of the same or different genders. If a child has 2 living and capable parents who choose to create a permanent bond by way of civil marriage, it is in the best interests of their child(ren) that legal and social institutions allow and support them to do so, irrespective of their sexual orientation. If 2 parents are not available to the child, adoption or foster parenting remain acceptable options to provide a loving home for a child and should be available without regard to the sexual orientation of the parent(s). (3/13)

PROMOTING THE WELL-BEING OF CHILDREN WHOSE PARENTS ARE GAY OR LESBIAN (TECHNICAL REPORT)

Ellen C. Perrin, MD, MA; Benjamin S. Siegel, MD; and Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. Extensive data available from more than 30 years of research reveal that children raised by gay and lesbian parents have demonstrated resilience with regard to social, psychological, and sexual health despite economic

and legal disparities and social stigma. Many studies have demonstrated that children's well-being is affected much more by their relationships with their parents, their parents' sense of competence and security, and the presence of social and economic support for the family than by the gender or the sexual orientation of their parents. Lack of opportunity for same-gender couples to marry adds to families' stress, which affects the health and welfare of all household members. Because marriage strengthens families and, in so doing, benefits children's development, children should not be deprived of the opportunity for their parents to be married. Paths to parenthood that include assisted reproductive techniques, adoption, and foster parenting should focus on competency of the parents rather than their sexual orientation. (3/13)

PROMOTION OF HEALTHY WEIGHT-CONTROL PRACTICES IN YOUNG ATHLETES

Committee on Sports Medicine and Fitness

ABSTRACT. Children and adolescents are often involved in sports in which weight loss or weight gain is perceived as an advantage. This policy statement describes unhealthy weight-control practices that may be harmful to the health and/or performance of athletes. Healthy methods of weight loss and weight gain are discussed, and physicians are given resources and recommendations that can be used to counsel athletes, parents, coaches, and school administrators in discouraging inappropriate weight-control behaviors and encouraging healthy methods of weight gain or loss, when needed. (12/05)

PROTECTING CHILDREN FROM SEXUAL ABUSE BY HEALTH CARE PROVIDERS

Committee on Child Abuse and Neglect

ABSTRACT. Sexual abuse or exploitation of children is never acceptable. Such behavior by health care providers is particularly concerning because of the trust that children and their families place on adults in the health care profession. The American Academy of Pediatrics strongly endorses the social and moral prohibition against sexual abuse or exploitation of children by health care providers. The academy opposes any such sexual abuse or exploitation by providers, particularly by the academy's members. Health care providers should be trained to recognize and abide by appropriate provider-patient boundaries. Medical institutions should screen staff members for a history of child abuse issues, train them to respect and maintain appropriate boundaries, and establish policies and procedures to receive and investigate concerns about patient abuse. Each person has a responsibility to ensure the safety of children in health care settings and to scrupulously follow appropriate legal and ethical reporting and investigation procedures. (6/11)

PROTECTIVE EYEWEAR FOR YOUNG ATHLETES

Committee on Sports Medicine and Fitness (joint with American Academy of Ophthalmology)

ABSTRACT. The American Academy of Pediatrics and American Academy of Ophthalmology strongly recommend protective eyewear for all participants in sports in which there is risk of eye injury. Protective eyewear should be mandatory for athletes who are functionally

1-eyed and for athletes whose ophthalmologists recommend eye protection after eye surgery or trauma. (3/04, reaffirmed 2/08, 6/11)

PROVIDING A PRIMARY CARE MEDICAL HOME FOR CHILDREN AND YOUTH WITH CEREBRAL PALSY (CLINICAL REPORT)

Gregory S. Liptak, MD, MPH; Nancy A. Murphy, MD; and Council on Children With Disabilities

ABSTRACT. All primary care providers will care for children with cerebral palsy in their practice. In addition to well-child and acute illness care, the role of the medical home in the management of these children includes diagnosis, planning for interventions, authorizing treatments, and follow-up. Optimizing health and well-being for children with cerebral palsy and their families entails family-centered care provided in the medical home; comanagement is the most common model. This report reviews the aspects of care specific to cerebral palsy that a medical home should provide beyond the routine health care needed by all children. (10/11)

PROVIDING A PRIMARY CARE MEDICAL HOME FOR CHILDREN AND YOUTH WITH SPINA BIFIDA (CLINICAL REPORT)

Robert Burke, MD, MPH; Gregory S. Liptak, MD, MPH; and Council on Children With Disabilities

ABSTRACT. The pediatric primary care provider in the medical home has a central and unique role in the care of children with spina bifida. The primary care provider addresses not only the typical issues of preventive and acute health care but also the needs specific to these children. Optimal care requires communication and comanagement with pediatric medical and developmental subspecialists, surgical specialists, therapists, and community providers. The medical home provider is essential in supporting the family and advocating for the child from the time of entry into the practice through adolescence, which includes transition and transfer to adult health care. This report reviews aspects of care specific to the infant with spina bifida (particularly myelomeningocele) that will facilitate optimal medical, functional, and developmental outcomes. (11/11)

PROVIDING CARE FOR CHILDREN AND ADOLESCENTS FACING HOMELESSNESS AND HOUSING INSECURITY

Council on Community Pediatrics

ABSTRACT. Child health and housing security are closely intertwined, and children without homes are more likely to suffer from chronic disease, hunger, and malnutrition than are children with homes. Homeless children and youth often have significant psychosocial development issues, and their education is frequently interrupted. Given the overall effects that homelessness can have on a child's health and potential, it is important for pediatricians to recognize the factors that lead to homelessness, understand the ways that homelessness and its causes can lead to poor health outcomes, and when possible, help children and families mitigate some of the effects of homelessness. Through practice change, partnership with community resources, awareness, and advocacy, pediatricians

can help optimize the health and well-being of children affected by homelessness. (5/13)

PROVIDING CARE FOR IMMIGRANT, MIGRANT, AND BORDER CHILDREN

Council on Community Pediatrics

ABSTRACT. This policy statement, which recognizes the large changes in immigrant status since publication of the 2005 statement "Providing Care for Immigrant, Homeless, and Migrant Children," focuses on strategies to support the health of immigrant children, infants, adolescents, and young adults. Homeless children will be addressed in a forthcoming separate statement ("Providing Care for Children and Adolescents Facing Homelessness and Housing Insecurity"). While recognizing the diversity across and within immigrant, migrant, and border populations, this statement provides a basic framework for serving and advocating for all immigrant children, with a particular focus on low-income and vulnerable populations. Recommendations include actions needed within and outside the health care system, including expansion of access to high-quality medical homes with culturally and linguistically effective care as well as education and literacy programs. The statement recognizes the unique and special role that pediatricians can play in the lives of immigrant children and families. Recommendations for policies that support immigrant child health are included. (5/13)

PROVISION OF EDUCATIONALLY RELATED SERVICES FOR CHILDREN AND ADOLESCENTS WITH CHRONIC DISEASES AND DISABLING CONDITIONS

Council on Children With Disabilities

ABSTRACT. Children and adolescents with chronic diseases and disabling conditions often need educationally related services. As medical home providers, physicians and other health care professionals can assist children, adolescents, and their families with the complex federal, state, and local laws, regulations, and systems associated with these services. Expanded roles for physicians and other health care professionals in individualized family service plan, individualized education plan, and Section 504 plan development and implementation are recommended. Recent updates to the Individuals With Disabilities Education Act will also affect these services. Funding for these services by private and nonprivate sources also continue to affect the availability of these educationally related services.

The complex range of federal, state, and local laws, regulations, and systems for special education and related services for children and adolescents in public schools is beyond the scope of this statement. Readers are referred to the American Academy of Pediatrics policy statement "The Pediatrician's Role in Development and Implementation of an Individual Education Plan (IEP) and/or an Individual Family Service Plan (IFSP)" for additional background materials. The focus of this statement is the role that health care professionals have in determining and managing educationally related services in the school setting.

This policy statement is a revision of a previous statement, "Provision of Educationally Related Services for

Children and Adolescents With Chronic Diseases and Disabling Conditions," published in February 2000 by the Committee on Children With Disabilities (<http://aappolicy.aappublications.org/cgi/content/full/pediatrics;105/2/448>). (6/07)

PSYCHOLOGICAL MALTREATMENT (CLINICAL REPORT)

Roberta Hibbard, MD; Jane Barlow, Dphil; Harriet

MacMillan, MD; Committee on Child Abuse and Neglect (joint with American Academy of Child and Adolescent Psychiatry Child Maltreatment and Violence Committee)

ABSTRACT. Psychological or emotional maltreatment of children may be the most challenging and prevalent form of child abuse and neglect. Caregiver behaviors include acts of omission (ignoring need for social interactions) or commission (spurning, terrorizing); may be verbal or nonverbal, active or passive, and with or without intent to harm; and negatively affect the child's cognitive, social, emotional, and/or physical development. Psychological maltreatment has been linked with disorders of attachment, developmental and educational problems, socialization problems, disruptive behavior, and later psychopathology. Although no evidence-based interventions that can prevent psychological maltreatment have been identified to date, it is possible that interventions shown to be effective in reducing overall types of child maltreatment, such as the Nurse Family Partnership, may have a role to play. Furthermore, prevention before occurrence will require both the use of universal interventions aimed at promoting the type of parenting that is now recognized to be necessary for optimal child development, alongside the use of targeted interventions directed at improving parental sensitivity to a child's cues during infancy and later parent-child interactions. Intervention should, first and foremost, focus on a thorough assessment and ensuring the child's safety. Potentially effective treatments include cognitive behavioral parenting programs and other psychotherapeutic interventions. The high prevalence of psychological abuse in advanced Western societies, along with the serious consequences, point to the importance of effective management. Pediatricians should be alert to the occurrence of psychological maltreatment and identify ways to support families who have risk indicators for, or evidence of, this problem. (7/12)

PSYCHOSOCIAL IMPLICATIONS OF DISASTER OR TERRORISM ON CHILDREN: A GUIDE FOR THE PEDIATRICIAN (CLINICAL REPORT)

Joseph F. Hagan, Jr, MD, Committee on Psychosocial Aspects of Child and Family Health, and Task Force on Terrorism

ABSTRACT. During and after disasters, pediatricians can assist parents and community leaders not only by accommodating the unique needs of children but also by being cognizant of the psychological responses of children to reduce the possibility of long-term psychological morbidity. The effects of disaster on children are mediated by many factors including personal experience, parental reaction, developmental competency, gender, and the stage of disaster response. Pediatricians can be effective advocates for the child and family and at the community level and can affect national policy in support of families. In this report, specific children's responses are delineated,

risk factors for adverse reactions are discussed, and advice is given for pediatricians to ameliorate the effects of disaster on children. (9/05)

PSYCHOSOCIAL RISKS OF CHRONIC HEALTH CONDITIONS IN CHILDHOOD AND ADOLESCENCE

Committee on Children With Disabilities and Committee on Psychosocial Aspects of Child and Family Health (12/93, reaffirmed 10/96)

PSYCHOSOCIAL SUPPORT FOR YOUTH LIVING WITH HIV (CLINICAL REPORT)

Jaime Martinez, MD, FAAP; Rana Chakraborty, MD, FAAP; and Committee on Pediatric AIDS

ABSTRACT. This clinical report provides guidance for the pediatrician in addressing the psychosocial needs of adolescents and young adults living with HIV, which can improve linkage to care and adherence to life-saving antiretroviral (ARV) therapy. Recent national case surveillance data for youth (defined here as adolescents and young adults 13 to 24 years of age) revealed that the burden of HIV/AIDS fell most heavily and disproportionately on African American youth, particularly males having sex with males. To effectively increase linkage to care and sustain adherence to therapy, interventions should address the immediate drivers of ARV compliance and also address factors that provide broader social and structural support for HIV-infected adolescents and young adults. Interventions should address psychosocial development, including lack of future orientation, inadequate educational attainment and limited health literacy, failure to focus on the long-term consequences of near-term risk behaviors, and coping ability. Associated challenges are closely linked to the structural environment. Individual case management is essential to linkage to and retention in care, ARV adherence, and management of associated comorbidities. Integrating these skills into pediatric and adolescent HIV practice in a medical home setting is critical, given the alarming increase in new HIV infections in youth in the United States. (2/14)

See full text on page 917.

QUALITY EARLY EDUCATION AND CHILD CARE FROM BIRTH TO KINDERGARTEN

Committee on Early Childhood, Adoption, and Dependent Care

ABSTRACT. High-quality early education and child care for young children improves their health and promotes their development and learning. Early education includes all of a child's experiences at home, in child care, and in other preschool settings. Pediatricians have a role in promoting access to quality early education and child care beginning at birth for all children. The American Academy of Pediatrics affords pediatricians the opportunity to promote the educational and socioemotional needs of young children with other advocacy groups. (1/05, reaffirmed 12/09)

RABIES-PREVENTION POLICY UPDATE: NEW REDUCED-DOSE SCHEDULE

Committee on Infectious Diseases

ABSTRACT. The Advisory Committee on Immunization Practices of the Centers for Disease Control and Prevention recommends reducing the number of doses from 5 to 4 of human diploid cell vaccine or purified chick embryo cell vaccine required for postexposure prophylaxis to prevent rabies in humans. The vaccine doses should be given on day 0 (first day of prophylaxis) and days 3, 7, and 14 after the first dose. For persons with immune suppression, the 5-dose regimen should continue to be used. Recommendations for the use of human rabies immunoglobulin remain unchanged. The American Academy of Pediatrics endorses these recommendations. (3/11)

RACE/ETHNICITY, GENDER, SOCIOECONOMIC STATUS—RESEARCH EXPLORING THEIR EFFECTS ON CHILD HEALTH: A SUBJECT REVIEW (CLINICAL REPORT)

Committee on Pediatric Research

ABSTRACT. Data on research participants and populations frequently include race, ethnicity, and gender as categorical variables, with the assumption that these variables exert their effects through innate or genetically determined biologic mechanisms. There is a growing body of research that suggests, however, that these variables have strong social dimensions that influence health. Socioeconomic status, a complicated construct in its own right, interacts with and confounds analyses of race/ethnicity and gender. The Academy recommends that research studies include race/ethnicity, gender, and socioeconomic status as explanatory variables only when data relevant to the underlying social mechanisms have been collected and included in the analyses. (6/00, reaffirmed 10/05, 1/09)

RACIAL AND ETHNIC DISPARITIES IN THE HEALTH AND HEALTH CARE OF CHILDREN (TECHNICAL REPORT)

Glenn Flores, MD, and Committee on Pediatric Research

ABSTRACT. *Objective.* This technical report reviews and synthesizes the published literature on racial/ethnic disparities in children's health and health care.

Methods. A systematic review of the literature was conducted for articles published between 1950 and March 2007. Inclusion criteria were peer-reviewed, original research articles in English on racial/ethnic disparities in the health and health care of US children. Search terms used included "child," "disparities," and the Index Medicus terms for each racial/ethnic minority group.

Results. Of 781 articles initially reviewed, 111 met inclusion criteria and constituted the final database. Review of the literature revealed that racial/ethnic disparities in children's health and health care are quite extensive, pervasive, and persistent. Disparities were noted across the spectrum of health and health care, including in mortality rates, access to care and use of services, prevention and population health, health status, adolescent health, chronic diseases, special health care needs, quality of care, and organ transplantation. Mortality-rate disparities were noted for children in all 4 major US racial/ethnic minority groups, including substantially greater risks than white children of all-cause mortality; death from

drowning, from acute lymphoblastic leukemia, and after congenital heart defect surgery; and an earlier median age at death for those with Down syndrome and congenital heart defects. Certain methodologic flaws were commonly observed among excluded studies, including failure to evaluate children separately from adults (22%), combining all nonwhite children into 1 group (9%), and failure to provide a white comparison group (8%). Among studies in the final database, 22% did not perform multivariable or stratified analyses to ensure that disparities persisted after adjustment for potential confounders.

Conclusions. Racial/ethnic disparities in children's health and health care are extensive, pervasive, and persistent, and occur across the spectrum of health and health care. Methodologic flaws were identified in how such disparities are sometimes documented and analyzed. Optimal health and health care for all children will require recognition of disparities as pervasive problems, methodologically sound disparities studies, and rigorous evaluation of disparities interventions. (3/10, reaffirmed 5/13)

RADIATION DISASTERS AND CHILDREN

Committee on Environmental Health

ABSTRACT. The special medical needs of children make it essential that pediatricians be prepared for radiation disasters, including 1) the detonation of a nuclear weapon; 2) a nuclear power plant event that unleashes a radioactive cloud; and 3) the dispersal of radionuclides by conventional explosive or the crash of a transport vehicle. Any of these events could occur unintentionally or as an act of terrorism. Nuclear facilities (eg, power plants, fuel processing centers, and food irradiation facilities) are often located in highly populated areas, and as they age, the risk of mechanical failure increases. The short- and long-term consequences of a radiation disaster are significantly greater in children for several reasons. First, children have a disproportionately higher minute ventilation, leading to greater internal exposure to radioactive gases. Children have a significantly greater risk of developing cancer even when they are exposed to radiation in utero. Finally, children and the parents of young children are more likely than are adults to develop enduring psychologic injury after a radiation disaster. The pediatrician has a critical role in planning for radiation disasters. For example, potassium iodide is of proven value for thyroid protection but must be given before or soon after exposure to radioiodines, requiring its placement in homes, schools, and child care centers. Pediatricians should work with public health authorities to ensure that children receive full consideration in local planning for a radiation disaster. (6/03, reaffirmed 1/07)

RADIATION RISK TO CHILDREN FROM COMPUTED TOMOGRAPHY (CLINICAL REPORT)

Alan S. Brody, MD; Donald P. Frush, MD; Walter Huda,

PhD; Robert L. Brent, MD, PhD; and Section on Radiology

ABSTRACT. Imaging studies that use ionizing radiation are an essential tool for the evaluation of many disorders of childhood. Ionizing radiation is used in radiography, fluoroscopy, angiography, and computed tomography scanning. Computed tomography is of particular interest because of its relatively high radiation dose and wide use.

Consensus statements on radiation risk suggest that it is reasonable to act on the assumption that low-level radiation may have a small risk of causing cancer. The medical community should seek ways to decrease radiation exposure by using radiation doses as low as reasonably achievable and by performing these studies only when necessary. There is wide agreement that the benefits of an indicated computed tomography scan far outweigh the risks. Pediatric health care professionals' roles in the use of computed tomography on children include deciding when a computed tomography scan is necessary and discussing the risk with patients and families. Radiologists should be a source of consultation when forming imaging strategies and should create specific protocols with scanning techniques optimized for pediatric patients. Families and patients should be encouraged to ask questions about the risks and benefits of computed tomography scanning. The information in this report is provided to aid in decision-making and discussions with the health care team, patients, and families. (9/07)

RECOGNITION AND MANAGEMENT OF IATROGENICALLY INDUCED OPIOID DEPENDENCE AND WITHDRAWAL IN CHILDREN (CLINICAL REPORT)

Jeffrey Galinkin, MD, FAAP; Jeffrey Lee Koh, MD, FAAP;

Committee on Drugs; and Section on Anesthesiology and Pain Medicine

ABSTRACT. Opioids are often prescribed to children for pain relief related to procedures, acute injuries, and chronic conditions. Round-the-clock dosing of opioids can produce opioid dependence within 5 days. According to a 2001 consensus paper from the American Academy of Pain Medicine, American Pain Society, and American Society of Addiction Medicine, dependence is defined as "a state of adaptation that is manifested by a drug class specific withdrawal syndrome that can be produced by abrupt cessation, rapid dose reduction, decreasing blood level of the drug, and/or administration of an antagonist." Although the experience of many children undergoing iatrogenically induced withdrawal may be mild or goes unreported, there is currently no guidance for recognition or management of withdrawal for this population. Guidance on this subject is available only for adults and primarily for adults with substance use disorders. The guideline will summarize existing literature and provide readers with information currently not available in any single source specific for this vulnerable pediatric population. (12/13)

RECOGNIZING AND RESPONDING TO MEDICAL NEGLECT (CLINICAL REPORT)

Carole Jenny, MD, MBA, and Committee on Child Abuse and Neglect

ABSTRACT. A caregiver may fail to recognize or respond to a child's medical needs for a variety of reasons. An effective response by a health care professional to medical neglect requires a comprehensive assessment of the child's needs, the parents' resources, the parents' efforts to provide for the needs of the child, and options for ensuring optimal health for the child. Such an assessment requires clear, 2-way communication between the family and the health care professional. Physicians should

consider the least intrusive options for managing cases of medical neglect that ensure the health and safety of the child. (12/07, reaffirmed 1/11)

RECOMMENDATION FOR MANDATORY INFLUENZA IMMUNIZATION OF ALL HEALTH CARE PERSONNEL

Henry H. Bernstein, DO; Jeffrey R. Starke, MD; and

Committee on Infectious Diseases

ABSTRACT. The purpose of this statement is to recommend implementation of a mandatory influenza immunization policy for all health care personnel. Immunization of health care personnel is a critically important step to substantially reduce health care-associated influenza infections. Despite the efforts of many organizations to improve influenza immunization rates with the use of voluntary campaigns, influenza coverage among health care personnel remains unacceptably low. Mandatory influenza immunization for all health care personnel is ethically justified, necessary, and long overdue to ensure patient safety. (9/10)

RECOMMENDATIONS FOR ADMINISTERING HEPATITIS A VACCINE TO CONTACTS OF INTERNATIONAL ADOPTEES

Committee on Infectious Diseases

ABSTRACT. The Advisory Committee on Immunization Practices of the Centers for Disease Control and Prevention and the American Academy of Pediatrics (AAP) recommend routine administration of hepatitis A vaccine for household members and close contacts, including baby-sitters, when children are adopted from countries with high or intermediate rates of hepatitis A infection. This policy expands previous AAP recommendations to immunize travelers to countries who are seeking to adopt a child in countries with high or medium hepatitis A endemicity. All previously nonimmune unvaccinated people who anticipate close exposure to international adoptees during the 60 days after their arrival should receive hepatitis A immunization, ideally 2 or more weeks before the arrival of the adopted child. (9/11)

RECOMMENDATIONS FOR PREVENTION AND CONTROL OF INFLUENZA IN CHILDREN, 2014–2015

Committee on Infectious Diseases

ABSTRACT. The purpose of this statement is to update recommendations for routine use of seasonal influenza vaccine and antiviral medications for the prevention and treatment of influenza in children. The American Academy of Pediatrics recommends annual seasonal influenza immunization for all people 6 months and older, including all children and adolescents. Highlights for the upcoming 2014–2015 season include the following:

1. The influenza vaccine composition for the 2014–2015 season is unchanged from the 2013–2014 season.
2. Both trivalent and quadrivalent influenza vaccines are available in the United States for the 2014–2015 season.
3. Annual universal influenza immunization is indicated with either a trivalent or quadrivalent vaccine (no preference).

4. Live attenuated influenza vaccine (LAIV) should be considered for healthy children 2 through 8 years of age who have no contraindications or precautions to the intranasal vaccine. If LAIV is not readily available, inactivated influenza vaccine (IIV) should be used; vaccination should not be delayed to obtain LAIV.
5. The dosing algorithm for administration of influenza vaccine to children 6 months through 8 years of age reflects that virus strains in the vaccine have not changed from last season.

As always, pediatricians, nurses, and all other health care personnel should be immunized themselves and should promote influenza vaccine use and infection control measures. In addition, pediatricians should promptly identify clinical influenza infections to enable rapid antiviral treatment, when indicated, to reduce morbidity and mortality. (10/14)

See full text on page 925.

RECOMMENDATIONS FOR PREVENTIVE PEDIATRIC HEALTH CARE

Committee on Practice and Ambulatory Medicine and Bright

Futures Steering Committee

ABSTRACT. Each child and family is unique; therefore, these Recommendations for Preventive Pediatric Health Care are designed for the care of children who are receiving competent parenting, have no manifestations of any important health problems, and are growing and developing in satisfactory fashion. Additional visits may become necessary if circumstances suggest variations from normal.

Developmental, psychosocial, and chronic disease issues for children and adolescents may require frequent counseling and treatment visits separate from preventive care visits.

These guidelines represent a consensus by the American Academy of Pediatrics (AAP) and Bright Futures. The AAP continues to emphasize the great importance of continuity of care in comprehensive health supervision and the need to avoid fragmentation of care. (12/07, reaffirmed 1/11)

RECOMMENDATIONS FOR THE PREVENTION OF PERINATAL GROUP B STREPTOCOCCAL (GBS) DISEASE

Committee on Infectious Diseases and Committee on Fetus and Newborn

ABSTRACT. The Centers for Disease Control and Prevention (CDC) guidelines for the prevention of perinatal group B streptococcal (GBS) disease were initially published in 1996. The American Academy of Pediatrics (AAP) also published a policy statement on this topic in 1997. In 2002, the CDC published revised guidelines that recommended universal antenatal GBS screening; the AAP endorsed these guidelines and published recommendations based on them in the 2003 *Red Book*. Since then, the incidence of early-onset GBS disease in neonates has decreased by an estimated 80%. However, in 2010, GBS disease remained the leading cause of early-onset neonatal sepsis. The CDC issued revised guidelines in 2010 based on evaluation of data generated after 2002. These

revised and comprehensive guidelines, which have been endorsed by the AAP, reaffirm the major prevention strategy—universal antenatal GBS screening and intrapartum antibiotic prophylaxis for culture-positive and high-risk women—and include new recommendations for laboratory methods for identification of GBS colonization during pregnancy, algorithms for screening and intrapartum prophylaxis for women with preterm labor and premature rupture of membranes, updated prophylaxis recommendations for women with a penicillin allergy, and a revised algorithm for the care of newborn infants. The purpose of this policy statement is to review and discuss the differences between the 2002 and 2010 CDC guidelines that are most relevant for the practice of pediatrics. (8/11)

RECOMMENDATIONS FOR THE PREVENTION OF *STREPTOCOCCUS PNEUMONIAE* INFECTIONS IN INFANTS AND CHILDREN: USE OF 13-VALENT PNEUMOCOCCAL CONJUGATE VACCINE (PCV13) AND PNEUMOCOCCAL POLYSACCHARIDE VACCINE (PPSV23)

Committee on Infectious Diseases

ABSTRACT. Routine use of the 7-valent pneumococcal conjugate vaccine (PCV7), available since 2000, has resulted in a dramatic reduction in the incidence of invasive pneumococcal disease (IPD) attributable to serotypes of *Streptococcus pneumoniae* contained in the vaccine. However, IPD caused by nonvaccine pneumococcal serotypes has increased, and nonvaccine serotypes are now responsible for the majority of the remaining cases of IPD occurring in children. A 13-valent pneumococcal conjugate vaccine has been licensed by the US Food and Drug Administration, which, in addition to the 7 serotypes included in the original PCV7, contains the 6 pneumococcal serotypes responsible for 63% of IPD cases now occurring in children younger than 5 years. Because of the expanded coverage provided by PCV13, it will replace PCV7. This statement provides recommendations for (1) the transition from PCV7 to PCV13; (2) the routine use of PCV13 for healthy children and children with an underlying medical condition that increases the risk of IPD; (3) a supplemental dose of PCV13 for (a) healthy children 14 through 59 months of age who have completed the PCV7 series and (b) children 14 through 71 months of age with an underlying medical condition that increases the risk of IPD who have completed the PCV7 series; (4) “catch-up” immunization for children behind schedule; and (5) PCV13 for certain children at high risk from 6 through 18 years of age. In addition, recommendations for the use of pneumococcal polysaccharide vaccine for children at high risk of IPD are also updated. (5/10)

RECOMMENDED CHILDHOOD AND ADOLESCENT IMMUNIZATION SCHEDULE—UNITED STATES, 2015

Committee on Infectious Diseases (1/15)

RED REFLEX EXAMINATION IN NEONATES, INFANTS, AND CHILDREN

Section on Ophthalmology (joint with American Association for Pediatric Ophthalmology and Strabismus, American Academy of Ophthalmology, and American Association of Certified Orthoptists)

ABSTRACT. Red reflex testing is an essential component of the neonatal, infant, and child physical examination. This statement, which is a revision of the previous policy statement published in 2002, describes the rationale for testing, the technique used to perform this examination, and the indications for referral to an ophthalmologist experienced in the examination of children. (12/08)

REDUCING INJURY RISK FROM BODY CHECKING IN BOYS' YOUTH ICE HOCKEY

Council on Sports Medicine and Fitness

ABSTRACT. Ice hockey is an increasingly popular sport that allows intentional collision in the form of body checking for males but not for females. There is a two- to threefold increased risk of all injury, severe injury, and concussion related to body checking at all levels of boys' youth ice hockey. The American Academy of Pediatrics reinforces the importance of stringent enforcement of rules to protect player safety as well as educational interventions to decrease unsafe tactics. To promote ice hockey as a lifelong recreational pursuit for boys, the American Academy of Pediatrics recommends the expansion of non-checking programs and the restriction of body checking to elite levels of boys' youth ice hockey, starting no earlier than 15 years of age. (5/14)

See full text on page 955.

REDUCING THE NUMBER OF DEATHS AND INJURIES FROM RESIDENTIAL FIRES

Committee on Injury and Poison Prevention

ABSTRACT. Smoke inhalation, severe burns, and death from residential fires are devastating events, most of which are preventable. In 1998, approximately 381 500 residential structure fires resulted in 3250 non-firefighter deaths, 17 175 injuries, and approximately \$4.4 billion in property loss. This statement reviews important prevention messages and intervention strategies related to residential fires. It also includes recommendations for pediatricians regarding office anticipatory guidance, work in the community, and support of regulation and legislation that could result in a decrease in the number of fire-related injuries and deaths to children. (6/00)

REDUCING THE RISK OF HIV INFECTION ASSOCIATED WITH ILLICIT DRUG USE

Committee on Pediatric AIDS

ABSTRACT. Substance abuse, specifically the use of illicit drugs that are administered intravenously, continues to play a role in the transmission of human immunodeficiency virus type 1 (HIV-1) among adolescents and young adults (youth). Risks of HIV-1 infection may result from direct exposure to contaminated blood through sharing of injection drug equipment and from unsafe sexual practices (while under the influence of drugs and/or in exchange for drugs). Reducing the risk of HIV-1 infection that is associated with illicit drug use requires prevention education and prompt engagement in treatment.

Providing patients with education, instruction on decontamination of used injection drug equipment, improved access to sterile syringes and needles, and postexposure prophylaxis may decrease their risk of acquiring HIV-1 infection. Pediatricians should assess risk behaviors as part of every health care encounter, including queries about tobacco, alcohol, and marijuana use. The risks and benefits of postexposure prophylaxis with antiretroviral drugs should be considered for youth with a single recent (within 72 hours) high-risk exposure to HIV-1 through sharing needles/syringes with an HIV-1-infected individual or having unprotected intercourse with an individual who engages in injection drug use. Such prophylaxis must be accompanied by risk-reduction counseling, appropriate referrals for treatment, and evaluation for pregnancy and associated sexually transmitted infections. There is an urgent need for more substance-abuse prevention and treatment programs, legislation that facilitates unencumbered access to sterile syringes, and expedient availability of reproductive health care services for sexually active youth, including voluntary HIV-1 counseling and testing. (2/06, reaffirmed 5/09, 5/12)

REFERRAL TO PEDIATRIC SURGICAL SPECIALISTS

Surgical Advisory Panel

ABSTRACT. The American Academy of Pediatrics, with the collaboration of the Surgical Sections of the American Academy of Pediatrics, has created referral recommendations intended to serve as voluntary practice parameters to assist general pediatricians in determining when and to whom to refer their patients for pediatric surgical specialty care. It is recognized that these recommendations may be difficult to implement, because communities vary in terms of access to major pediatric medical centers. Limited access does not negate the value of the recommendations, however, because the child who needs specialized surgical and anesthetic care is best served by the skills of the appropriate pediatric surgical team. Major congenital anomalies, malignancies, major trauma, and chronic illnesses (including those associated with preterm birth) in infants and children should be managed by pediatric medical subspecialists and pediatric surgical specialists at pediatric referral centers that can provide expertise in many areas, including the pediatric medical subspecialties and surgical specialties of pediatric radiology, pediatric anesthesiology, pediatric pathology, and pediatric intensive care. The optimal management of the child with complex problems, chronic illness, or disabilities requires coordination, communication, and cooperation of the pediatric surgical specialist with the child's primary care pediatrician or physician. (1/14)

REIMBURSEMENT FOR FOODS FOR SPECIAL DIETARY USE

Committee on Nutrition

ABSTRACT. Foods for special dietary use are recommended by physicians for chronic diseases or conditions of childhood, including inherited metabolic diseases. Although many states have created legislation requiring reimbursement for foods for special dietary use, legisla-

tion is now needed to mandate consistent coverage and reimbursement for foods for special dietary use and related support services with accepted medical benefit for children with designated medical conditions. (5/03, reaffirmed 1/06)

RELIEF OF PAIN AND ANXIETY IN PEDIATRIC PATIENTS IN EMERGENCY MEDICAL SYSTEMS (CLINICAL REPORT)

Joel A. Fein, MD, MPH; William T. Zempsky, MD, MPH;

Joseph P. Cravero, MD; Committee on Pediatric Emergency Medicine; and Section on Anesthesiology and Pain Medicine

ABSTRACT. Control of pain and stress for children is a vital component of emergency medical care. Timely administration of analgesia affects the entire emergency medical experience and can have a lasting effect on a child's and family's reaction to current and future medical care. A systematic approach to pain management and anxiolysis, including staff education and protocol development, can provide comfort to children in the emergency setting and improve staff and family satisfaction. (10/12)

RELIGIOUS OBJECTIONS TO MEDICAL CARE

Committee on Bioethics

ABSTRACT. Parents sometimes deny their children the benefits of medical care because of religious beliefs. In some jurisdictions, exemptions to child abuse and neglect laws restrict government action to protect children or seek legal redress when the alleged abuse or neglect has occurred in the name of religion. The American Academy of Pediatrics (AAP) believes that all children deserve effective medical treatment that is likely to prevent substantial harm or suffering or death. In addition, the AAP advocates that all legal interventions apply equally whenever children are endangered or harmed, without exemptions based on parental religious beliefs. To these ends, the AAP calls for the repeal of religious exemption laws and supports additional efforts to educate the public about the medical needs of children. (2/97, reaffirmed 10/00, 6/03, 10/06, 5/09)

RESPIRATORY SUPPORT IN PRETERM INFANTS AT BIRTH

Committee on Fetus and Newborn

ABSTRACT. Current practice guidelines recommend administration of surfactant at or soon after birth in preterm infants with respiratory distress syndrome. However, recent multicenter randomized controlled trials indicate that early use of continuous positive airway pressure with subsequent selective surfactant administration in extremely preterm infants results in lower rates of bronchopulmonary dysplasia/death when compared with treatment with prophylactic or early surfactant therapy. Continuous positive airway pressure started at or soon after birth with subsequent selective surfactant administration may be considered as an alternative to routine intubation with prophylactic or early surfactant administration in preterm infants. (12/13)

RESPONDING TO PARENTAL REFUSALS OF IMMUNIZATION OF CHILDREN (CLINICAL REPORT)

Douglas S. Diekema, MD, MPH, and Committee on Bioethics
ABSTRACT. The American Academy of Pediatrics strongly endorses universal immunization. However, for childhood immunization programs to be successful, parents must comply with immunization recommendations. The problem of parental refusal of immunization for children is an important one for pediatricians. The goal of this report is to assist pediatricians in understanding the reasons parents may have for refusing to immunize their children, review the limited circumstances under which parental refusals should be referred to child protective services agencies or public health authorities, and provide practical guidance to assist the pediatrician faced with a parent who is reluctant to allow immunization of his or her child. (5/05, reaffirmed 1/09, 11/12)

RESTRAINT USE ON AIRCRAFT

Committee on Injury and Poison Prevention

ABSTRACT. Occupant protection policies for children younger than 2 years on aircraft are inconsistent with all other national policies on safe transportation. Children younger than 2 years are not required to be restrained or secured on aircraft during takeoff, landing, and conditions of turbulence. They are permitted to be held on the lap of an adult. Preventable injuries and deaths have occurred in aircraft during survivable crashes and conditions of turbulence. The American Academy of Pediatrics recommends a mandatory federal requirement for restraint use for children on aircraft. The Academy further recommends that parents ensure that a seat is available for all children during aircraft transport and follow current recommendations for restraint use for all children. Physicians play a significant role in counseling families, advocating for public policy mandates, and encouraging technologic research that will improve protection of children in aircraft. (11/01, reaffirmed 5/05, 10/08)

RETURNING TO LEARNING FOLLOWING A CONCUSSION (CLINICAL REPORT)

Mark E. Halstead, MD, FAAP; Karen McAvoy, PsyD; Cynthia D. Devore, MD, FAAP; Rebecca Carl, MD, FAAP; Michael Lee, MD, FAAP; Kelsey Logan, MD, FAAP; Council on Sports Medicine and Fitness; and Council on School Health

ABSTRACT. Following a concussion, it is common for children and adolescents to experience difficulties in the school setting. Cognitive difficulties, such as learning new tasks or remembering previously learned material, may pose challenges in the classroom. The school environment may also increase symptoms with exposure to bright lights and screens or noisy cafeterias and hallways. Unfortunately, because most children and adolescents look physically normal after a concussion, school officials often fail to recognize the need for academic or environmental adjustments. Appropriate guidance and recommendations from the pediatrician may ease the transition back to the school environment and facilitate the recovery of the child or adolescent. This report serves to provide a better understanding of possible factors that may contrib-

ute to difficulties in a school environment after a concussion and serves as a framework for the medical home, the educational home, and the family home to guide the student to a successful and safe return to learning. (10/13)

RITUAL GENITAL CUTTING OF FEMALE MINORS

Board of Directors (6/10)

ROLE OF PEDIATRICIANS IN ADVOCATING LIFE SUPPORT TRAINING COURSES FOR PARENTS AND THE PUBLIC

Committee on Pediatric Emergency Medicine

ABSTRACT. Available literature suggests a need for both initial cardiopulmonary resuscitation basic life support training and refresher courses for parents and the public as well as health care professionals. The promotion of basic life support training courses that establish a pediatric chain of survival spanning from prevention of cardiac arrest and trauma to rehabilitative and follow-up care for victims of cardiopulmonary arrest is advocated in this policy statement and is the focus of an accompanying technical report. Immediate bystander cardiopulmonary resuscitation for victims of cardiac arrest improves survival for out-of-hospital cardiac arrest. Pediatricians will improve the chance of survival of children and adults who experience cardiac arrest by advocating for cardiopulmonary resuscitation training and participating in basic life support training courses as participants and instructors. (12/04, reaffirmed 5/07, 8/10, 8/13)

ROLE OF PEDIATRICIANS IN ADVOCATING LIFE SUPPORT TRAINING COURSES FOR PARENTS AND THE PUBLIC (TECHNICAL REPORT)

Lee A. Pyles, MD; Jane Knapp, MD; and Committee on Pediatric Emergency Medicine

ABSTRACT. Available literature suggests a need for both initial cardiopulmonary resuscitation training and refresher courses. The establishment of a pediatric chain of survival for victims of cardiopulmonary arrest is the focus of this technical report and is advocated in the accompanying policy statement. Immediate bystander cardiopulmonary resuscitation for victims of cardiac arrest improves survival for out-of-hospital cardiac arrest. Pediatricians will improve the chance of survival of children and adults who experience cardiac arrest by advocating for basic life support training and participating in basic life support courses as participants and teachers. (12/04, reaffirmed 5/07, 8/10, 1/14)

THE ROLE OF PRESCHOOL HOME-VISITING PROGRAMS IN IMPROVING CHILDREN'S DEVELOPMENTAL AND HEALTH OUTCOMES

Council on Community Pediatrics

ABSTRACT. Child health and developmental outcomes depend to a large extent on the capabilities of families to provide a nurturing, safe environment for their infants and young children. Unfortunately, many families have insufficient knowledge about parenting skills and an inadequate support system of friends, extended family, or professionals to help with or advise them regarding child rearing. Home-visiting programs offer a mechanism for ensuring that at-risk families have social support, linkage with public and private community services, and ongoing

health, developmental, and safety education. When these services are part of a system of high-quality well-child care linked or integrated with the pediatric medical home, they have the potential to mitigate health and developmental outcome disparities. This statement reviews the history of home visiting in the United States and reaffirms the support of the American Academy of Pediatrics for home-based parenting education and support. (1/09)

ROLE OF PULSE OXIMETRY IN EXAMINING NEWBORNS FOR CONGENITAL HEART DISEASE: A SCIENTIFIC STATEMENT FROM THE AHA AND AAP

William T. Mahle, MD; Jane W. Newburger, MD, MPH; G. Paul Matherne, MD; Frank C. Smith, MD; Tracey R. Hoke, MD; Robert Koppel, MD; Samuel S. Gidding, MD; Robert H. Beekman, III, MD; Scott D. Grosse, PhD; on behalf of Section on Cardiology and Cardiac Surgery and Committee of Fetus and Newborn (joint with American Heart Association Congenital Heart Defects Committee of the Council on Cardiovascular Disease in the Young, Council on Cardiovascular Nursing, and Interdisciplinary Council on Quality of Care and Outcomes Research)

ABSTRACT. *Background.* The purpose of this statement is to address the state of evidence on the routine use of pulse oximetry in newborns to detect critical congenital heart disease (CCHD).

Methods and Results. A writing group appointed by the American Heart Association and the American Academy of Pediatrics reviewed the available literature addressing current detection methods for CCHD, burden of missed and/or delayed diagnosis of CCHD, rationale of oximetry screening, and clinical studies of oximetry in otherwise asymptomatic newborns. MEDLINE database searches from 1966 to 2008 were done for English-language papers using the following search terms: congenital heart disease, pulse oximetry, physical examination, murmur, echocardiography, fetal echocardiography, and newborn screening. The reference lists of identified papers were also searched. Published abstracts from major pediatric scientific meetings in 2006 to 2008 were also reviewed. The American Heart Association classification of recommendations and levels of evidence for practice guidelines were used. In an analysis of pooled studies of oximetry assessment performed after 24 hours of life, the estimated sensitivity for detecting CCHD was 69.6%, and the positive predictive value was 47.0%; however, sensitivity varied dramatically among studies from 0% to 100%. False-positive screens that required further evaluation occurred in only 0.035% of infants screened after 24 hours.

Conclusions. Currently, CCHD is not detected in some newborns until after their hospital discharge, which results in significant morbidity and occasional mortality. Furthermore, routine pulse oximetry performed on asymptomatic newborns after 24 hours of life, but before hospital discharge, may detect CCHD. Routine pulse oximetry performed after 24 hours in hospitals that have on-site pediatric cardiovascular services incurs very low cost and risk of harm. Future studies in larger populations and across a broad range of newborn delivery systems are needed to determine whether this practice should become standard of care in the routine assessment of the neonate. (8/09)

THE ROLE OF SCHOOLS IN COMBATING ILLICIT SUBSTANCE ABUSE

Council on School Health and Committee on Substance Abuse
ABSTRACT. Disturbingly high levels of illicit drug use remain a problem among American teenagers. As the physical, social, and psychological “home away from home” for most youth, schools naturally assume a primary role in substance abuse education, prevention, and early identification. However, the use of random drug testing on students as a component of drug prevention programs requires additional, more rigorous scientific evaluation. Widespread implementation should await the result of ongoing studies to address the effectiveness of testing and evaluate possible inadvertent harm. If drug testing on students is conducted, it should never be implemented in isolation. A comprehensive assessment and therapeutic management program for the student who tests positive should be in place before any testing is performed. Schools have the opportunity to work with parents, health care professionals, and community officials to use programs with proven effectiveness, to identify students who show behavioral risks for drug-related problems, and to make referrals to a student’s medical home. When use of an illicit substance is detected, schools can foster relationships with established health care experts to assist them. A student undergoing individualized intervention for using illicit substances merits privacy. This requires that awareness of the student’s situation be limited to parents, the student’s physician, and only those designated school health officials with a need to know. For the purposes of this statement, alcohol, tobacco, and inhalants are not addressed. (12/07)

ROLE OF THE MEDICAL HOME IN FAMILY-CENTERED EARLY INTERVENTION SERVICES

Council on Children With Disabilities

ABSTRACT. There is growing evidence that early intervention services have a positive influence on the developmental outcome of children with established disabilities as well as those who are considered to be “at risk” of disabilities. Various federal and state laws now mandate the establishment of community-based, coordinated, multidisciplinary, family-centered programs that are accessible to children and families. The medical home, in close collaboration with the family and the early intervention team, can play a critical role in ensuring that at-risk children receive appropriate clinical and developmental early intervention services. The purpose of this statement is to assist the pediatric health care professional in assuming a proactive role with the interdisciplinary team that provides early intervention services. (11/07)

THE ROLE OF THE PEDIATRICIAN IN RURAL EMERGENCY MEDICAL SERVICES FOR CHILDREN

Committee on Pediatric Emergency Medicine

ABSTRACT. In rural America, pediatricians can play a key role in the development, implementation, and ongoing supervision of emergency medical services for children (EMSC). Pediatricians may represent the only source of pediatric expertise for a large region and are a vital resource for rural physicians (eg, general and family practice, emergency medicine) and other rural health care

professionals (physician assistants, nurse practitioners, and emergency medical technicians), providing education about management and prevention of pediatric illness and injury; appropriate equipment for the acutely ill or injured child; and acute, chronic, and rehabilitative care. In addition to providing clinical expertise, the pediatrician may be involved in quality assurance, clinical protocol development, and advocacy, and may serve as a liaison between emergency medical services and other entities working with children (eg, school nurses, child care centers, athletic programs, and programs for children with special health care needs). (10/12)

ROLE OF THE PEDIATRICIAN IN YOUTH VIOLENCE PREVENTION

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Youth violence continues to be a serious threat to the health of children and adolescents in the United States. It is crucial that pediatricians clearly define their role and develop the appropriate skills to address this threat effectively. From a clinical perspective, pediatricians should become familiar with *Connected Kids: Safe, Strong, Secure*, the American Academy of Pediatrics' primary care violence prevention protocol. Using this material, practices can incorporate preventive education, screening for risk, and linkages to community-based counseling and treatment resources. As advocates, pediatricians may bring newly developed information regarding key risk factors such as exposure to firearms, teen dating violence, and bullying to the attention of local and national policy makers. This policy statement refines the developing role of pediatricians in youth violence prevention and emphasizes the importance of this issue in the strategic agenda of the American Academy of Pediatrics. (6/09)

ROLE OF THE SCHOOL NURSE IN PROVIDING SCHOOL HEALTH SERVICES

Council on School Health

ABSTRACT. The school nurse has a crucial role in the seamless provision of comprehensive health services to children and youth. Increasing numbers of students enter schools with chronic health conditions that require management during the school day. This policy statement describes for pediatricians the role of the school nurse in serving as a team member in providing preventive services, early identification of problems, interventions, and referrals to foster health and educational success. To optimally care for children, preparation, ongoing education, and appropriate staffing levels of school nurses are important factors for success. Recommendations are offered to facilitate the working relationship between the school nurse and the child's medical home. This statement has been endorsed by the National Association of School Nurses. (5/08)

ROLE OF THE SCHOOL PHYSICIAN

Council on School Health

ABSTRACT. The American Academy of Pediatrics recognizes the important role physicians play in promoting the optimal biopsychosocial well-being of children in the school setting. Although the concept of a school physician

has existed for more than a century, uniformity among states and school districts regarding physicians in schools and the laws governing it are lacking. By understanding the roles and contributions physicians can make to schools, pediatricians can support and promote school physicians in their communities and improve health and safety for children. (12/12)

SAFE TRANSPORTATION OF NEWBORNS AT HOSPITAL DISCHARGE

Committee on Injury and Poison Prevention

ABSTRACT. All hospitals should set policies that require the discharge of every newborn in a car safety seat that is appropriate for the infant's maturity and medical condition. Discharge policies for newborns should include a parent education component, regular review of educational materials, and periodic in-service education for responsible staff. Appropriate child restraint systems should become a benefit of coverage by Medicaid, managed care organizations, and other third-party insurers. (10/99, reaffirmed 1/03, 1/06, 10/08)

SAFE TRANSPORTATION OF PRETERM AND LOW BIRTH WEIGHT INFANTS AT HOSPITAL DISCHARGE (CLINICAL REPORT)

Marilyn J. Bull, MD; William A. Engle, MD; Committee on Injury, Violence, and Poison Prevention; and Committee on Fetus and Newborn

ABSTRACT. Safe transportation of preterm and low birth weight infants requires special considerations. Both physiologic immaturity and low birth weight must be taken into account to properly position such infants. This clinical report provides guidelines for pediatricians and other caregivers who counsel parents of preterm and low birth weight infants about car safety seats. (4/09, reaffirmed 8/13)

SCHOOL BUS TRANSPORTATION OF CHILDREN WITH SPECIAL HEALTH CARE NEEDS

Committee on Injury and Poison Prevention (8/01, reaffirmed 1/05, 2/08, 5/13)

SCHOOL HEALTH ASSESSMENTS

Committee on School Health

ABSTRACT. Comprehensive health assessments often are performed in school-based clinics or public health clinics by health professionals other than pediatricians. Pediatricians or other physicians skilled in child health care should participate in such evaluations. This statement provides guidance on the scope of in-school health assessments and the roles of the pediatrician, school nurse, school, and community. (4/00, reaffirmed 6/03, 5/06, 10/11)

SCHOOL HEALTH CENTERS AND OTHER INTEGRATED SCHOOL HEALTH SERVICES

Committee on School Health

ABSTRACT. This statement offers guidelines on the integration of expanded school health services, including school-based and school-linked health centers, into community-based health care systems. Expanded school health services should be integrated so that they enhance accessibility, provide high-quality health care, link chil-

dren to a medical home, are financially sustainable, and address both long- and short-term needs of children and adolescents. (1/01)

SCHOOL READINESS (TECHNICAL REPORT)

Pamela C. High, MD; Committee on Early Childhood, Adoption, and Dependent Care; and Council on School Health

ABSTRACT. School readiness includes the readiness of the individual child, the school's readiness for children, and the ability of the family and community to support optimal early child development. It is the responsibility of schools to be ready for all children at all levels of readiness. Children's readiness for kindergarten should become an outcome measure for community-based programs, rather than an exclusion criterion at the beginning of the formal educational experience. Our new knowledge of early brain and child development has revealed that modifiable factors in a child's early experience can greatly affect that child's learning trajectory. Many US children enter kindergarten with limitations in their social, emotional, cognitive, and physical development that might have been significantly diminished or eliminated through early identification of and attention to child and family needs. Pediatricians have a role in promoting school readiness for all children, beginning at birth, through their practices and advocacy. The American Academy of Pediatrics affords pediatricians many opportunities to promote the physical, social-emotional, and educational health of young children, with other advocacy groups. This technical report supports American Academy of Pediatrics policy statements "Quality Early Education and Child Care From Birth to Kindergarten" and "The Inappropriate Use of School 'Readiness' Tests." (4/08, reaffirmed 9/13)

SCHOOL START TIMES FOR ADOLESCENTS

Adolescent Sleep Working Group, Committee on Adolescence, and Council on School Health

ABSTRACT. The American Academy of Pediatrics recognizes insufficient sleep in adolescents as an important public health issue that significantly affects the health and safety, as well as the academic success, of our nation's middle and high school students. Although a number of factors, including biological changes in sleep associated with puberty, lifestyle choices, and academic demands, negatively affect middle and high school students' ability to obtain sufficient sleep, the evidence strongly implicates earlier school start times (ie, before 8:30 AM) as a key modifiable contributor to insufficient sleep, as well as circadian rhythm disruption, in this population. Furthermore, a substantial body of research has now demonstrated that delaying school start times is an effective countermeasure to chronic sleep loss and has a wide range of potential benefits to students with regard to physical and mental health, safety, and academic achievement. The American Academy of Pediatrics strongly supports the efforts of school districts to optimize sleep in students and urges high schools and middle schools to aim for start times that allow students the opportunity to achieve optimal levels of sleep (8.5–9.5 hours) and to improve physical (eg, reduced obesity risk) and mental (eg, lower rates of

depression) health, safety (eg, drowsy driving crashes), academic performance, and quality of life. (8/14)

See full text on page 975.

SCHOOL TRANSPORTATION SAFETY

Committee on Injury, Violence, and Poison Prevention and Council on School Health

ABSTRACT. This policy statement replaces the previous version published in 1996. It provides new information, studies, regulations, and recommendations related to the safe transportation of children to and from school and school-related activities. Pediatricians can play an important role at the patient/family, community, state, and national levels as child advocates and consultants to schools and early education programs about transportation safety. (7/07, reaffirmed 10/11)

SCHOOL-BASED HEALTH CENTERS AND PEDIATRIC PRACTICE

Council on School Health

ABSTRACT. School-based health centers (SBHCs) have become an important method of health care delivery for the youth of our nation. Although they only represent 1 aspect of a coordinated school health program approach, SBHCs have provided access to health care services for youth confronted with age, financial, cultural, and geographic barriers. A fundamental principle of SBHCs is to create an environment of service coordination and collaboration that addresses the health needs and well-being of youth with health disparities or poor access to health care services. Some pediatricians have concerns that these centers are in conflict with the primary care provider's medical home. This policy provides an overview of SBHCs and some of their documented benefits, addresses the issue of potential conflict with the medical home, and provides recommendations that support the integration and coordination of SBHCs and the pediatric medical home practice. (1/12)

SCHOOL-BASED MENTAL HEALTH SERVICES

Committee on School Health

ABSTRACT. More than 20% of children and adolescents have mental health problems. Health care professionals for children and adolescents must educate key stakeholders about the extent of these problems and work together with them to increase access to mental health resources. School-based programs offer the promise of improving access to diagnosis of and treatment for the mental health problems of children and adolescents. Pediatric health care professionals, educators, and mental health specialists should work in collaboration to develop and implement effective school-based mental health services. (6/04, reaffirmed 5/09)

SCOPE OF HEALTH CARE BENEFITS FOR CHILDREN FROM BIRTH THROUGH AGE 26

Committee on Child Health Financing

ABSTRACT. The optimal health of all children is best achieved with access to appropriate and comprehensive health care benefits. This policy statement outlines and defines the recommended set of health insurance benefits for children through age 26. The American Academy of Pediatrics developed a set of recommendations concern-

ing preventive care services for children, adolescents, and young adults. These recommendations are compiled in the publication *Bright Futures: Guidelines for Health Supervision of Infants, Children, and Adolescents*, third edition. The Bright Futures recommendations were referenced as a standard for access and design of age-appropriate health insurance benefits for infants, children, adolescents, and young adults in the Patient Protection and Affordable Care Act of 2010 (Pub L No. 114-148). (11/11)

SCOPE OF PRACTICE ISSUES IN THE DELIVERY OF PEDIATRIC HEALTH CARE

Committee on Pediatric Workforce

ABSTRACT. The American Academy of Pediatrics (AAP) believes that optimal pediatric health care depends on a team-based approach with supervision by a physician leader, preferably a pediatrician. The pediatrician, here defined to include not only pediatric generalists but all pediatric medical subspecialists, all surgical specialists, and internal medicine/pediatric physicians, is uniquely qualified to manage, coordinate, and supervise the entire spectrum of pediatric care, from diagnosis through all stages of treatment, in all practice settings. The AAP recognizes the valuable contributions of nonphysician clinicians, including nurse practitioners and physician assistants, in delivering optimal pediatric care. However, the expansion of the scope of practice of nonphysician pediatric clinicians raises critical public policy and child health advocacy concerns. Pediatricians should serve as advocates for optimal pediatric care in state legislatures, public policy forums, and the media and should pursue opportunities to resolve scope of practice conflicts outside state legislatures. The AAP affirms the importance of appropriate documentation and standards in pediatric education, training, skills, clinical competencies, examination, regulation, and patient care to ensure safety and quality health care for all infants, children, adolescents, and young adults. (5/13)

SCREENING EXAMINATION OF PREMATURE INFANTS FOR RETINOPATHY OF PREMATURITY

Section on Ophthalmology (joint with American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists)

ABSTRACT. This statement revises a previous statement on screening of preterm infants for retinopathy of prematurity (ROP) that was published in 2006. ROP is a pathologic process that occurs only in immature retinal tissue and can progress to a tractional retinal detachment, which can result in functional or complete blindness. Use of peripheral retinal ablative therapy by using laser photocoagulation for nearly 2 decades has resulted in a high probability of markedly decreasing the incidence of this poor visual outcome, but the sequential nature of ROP creates a requirement that at-risk preterm infants be examined at proper times and intervals to detect the changes of ROP before they become permanently destructive. This statement presents the attributes on which an effective program for detecting and treating ROP could be based, including the timing of initial examination and subsequent reexamination intervals. (12/12)

SCREENING FOR NONVIRAL SEXUALLY TRANSMITTED INFECTIONS IN ADOLESCENTS AND YOUNG ADULTS

Committee on Adolescence (joint with Society for Adolescent Health and Medicine)

ABSTRACT. Prevalence rates of many sexually transmitted infections (STIs) are highest among adolescents. If nonviral STIs are detected early, they can be treated, transmission to others can be eliminated, and sequelae can be averted. The US Preventive Services Task Force and the Centers for Disease Control and Prevention have published chlamydia, gonorrhea, and syphilis screening guidelines that recommend screening those at risk on the basis of epidemiologic and clinical outcomes data. This policy statement specifically focuses on these curable, nonviral STIs and reviews the evidence for nonviral STI screening in adolescents, communicates the value of screening, and outlines recommendations for routine nonviral STI screening of adolescents. (6/14)

SCREENING FOR RETINOPATHY IN THE PEDIATRIC PATIENT WITH TYPE 1 DIABETES MELLITUS (CLINICAL REPORT)

Gregg T. Lueder, MD; Janet Silverstein, MD; Section on Ophthalmology; and Section on Endocrinology (joint with American Association for Pediatric Ophthalmology and Strabismus)

ABSTRACT. Diabetic retinopathy (DR) is the leading cause of blindness in young adults in the United States. Early identification and treatment of DR can decrease the risk of vision loss in affected patients. This clinical report reviews the risk factors for the development of DR and screening guidance for pediatric patients with type 1 diabetes mellitus. (7/05, reaffirmed 1/09, 7/14)

SECONDHAND AND PRENATAL TOBACCO SMOKE EXPOSURE (TECHNICAL REPORT)

Dana Best, MD, MPH; Committee on Environmental Health; Committee on Native American Child Health; and Committee on Adolescence

ABSTRACT. Secondhand tobacco smoke (SHS) exposure of children and their families causes significant morbidity and mortality. In their personal and professional roles, pediatricians have many opportunities to advocate for elimination of SHS exposure of children, to counsel tobacco users to quit, and to counsel children never to start. This report discusses the harms of tobacco use and SHS exposure, the extent and costs of tobacco use and SHS exposure, and the evidence that supports counseling and other clinical interventions in the cycle of tobacco use. Recommendations for future research, policy, and clinical practice change are discussed. To improve understanding and provide support for these activities, the harms of SHS exposure are discussed, effective ways to eliminate or reduce SHS exposure are presented, and policies that support a smoke-free environment are outlined. (10/09, reaffirmed 5/14)

SELECTING APPROPRIATE TOYS FOR YOUNG CHILDREN: THE PEDIATRICIAN'S ROLE (CLINICAL REPORT)

Committee on Early Childhood, Adoption, and Dependent Care

ABSTRACT. Play is essential for learning in children. Toys are the tools of play. Which play materials are provided

and how they are used are equally important. Adults caring for children can be reminded that toys facilitate but do not substitute for the most important aspect of nurture—warm, loving, dependable relationships. Toys should be safe, affordable, and developmentally appropriate. Children do not need expensive toys. Toys should be appealing to engage the child over a period of time. Information and resources are provided in this report so pediatricians can give parents advice about selecting toys. (4/03, reaffirmed 10/06, 5/11)

SELF-INJECTABLE EPINEPHRINE FOR FIRST-AID MANAGEMENT OF ANAPHYLAXIS (CLINICAL REPORT)

Scott H. Sicherer, MD; F. Estelle R. Simons, MD; and Section on Allergy and Immunology

ABSTRACT. Anaphylaxis is a severe, potentially fatal systemic allergic reaction that is rapid in onset and may cause death. Epinephrine is the primary medical therapy, and it must be administered promptly. This clinical report focuses on practical issues concerning the administration of self-injectable epinephrine for first-aid treatment of anaphylaxis in the community. The recommended epinephrine dose for anaphylaxis in children, based primarily on anecdotal evidence, is 0.01 mg/kg, up to 0.30 mg. Intramuscular injection of epinephrine into the lateral thigh (vastus lateralis) is the preferred route for therapy in first-aid treatment. Epinephrine autoinjectors are currently available in only 2 fixed doses: 0.15 and 0.30 mg. On the basis of current, albeit limited, data, it seems reasonable to recommend autoinjectors with 0.15 mg of epinephrine for otherwise healthy young children who weigh 10 to 25 kg (22–55 lb) and autoinjectors with 0.30 mg of epinephrine for those who weigh approximately 25 kg (55 lb) or more; however, specific clinical circumstances must be considered in these decisions. This report also describes several quandaries in regard to management, including the selection of dose, indications for prescribing an autoinjector, and decisions regarding when to inject epinephrine. Effective care for individuals at risk of anaphylaxis requires a comprehensive management approach involving families, allergic children, schools, camps, and other youth organizations. Risk reduction entails confirmation of the trigger, discussion of avoidance of the relevant allergen, a written individualized emergency anaphylaxis action plan, and education of supervising adults with regard to recognition and treatment of anaphylaxis. (3/07)

SENSORY INTEGRATION THERAPIES FOR CHILDREN WITH DEVELOPMENTAL AND BEHAVIORAL DISORDERS

Section on Complementary and Integrative Medicine and Council on Children With Disabilities

ABSTRACT. Sensory-based therapies are increasingly used by occupational therapists and sometimes by other types of therapists in treatment of children with developmental and behavioral disorders. Sensory-based therapies involve activities that are believed to organize the sensory system by providing vestibular, proprioceptive, auditory, and tactile inputs. Brushes, swings, balls, and other specially designed therapeutic or recreational equipment are used to provide these inputs. However, it is unclear whether children who present with sensory-based problems have an actual “disorder” of the sensory pathways of

the brain or whether these deficits are characteristics associated with other developmental and behavioral disorders. Because there is no universally accepted framework for diagnosis, sensory processing disorder generally should not be diagnosed. Other developmental and behavioral disorders must always be considered, and a thorough evaluation should be completed. Difficulty tolerating or processing sensory information is a characteristic that may be seen in many developmental behavioral disorders, including autism spectrum disorders, attention-deficit/hyperactivity disorder, developmental coordination disorders, and childhood anxiety disorders.

Occupational therapy with the use of sensory-based therapies may be acceptable as one of the components of a comprehensive treatment plan. However, parents should be informed that the amount of research regarding the effectiveness of sensory integration therapy is limited and inconclusive. Important roles for pediatricians and other clinicians may include discussing these limitations with parents, talking with families about a trial period of sensory integration therapy, and teaching families how to evaluate the effectiveness of a therapy. (5/12)

SEXUAL ORIENTATION AND ADOLESCENTS (CLINICAL REPORT)

Committee on Adolescence

ABSTRACT. The American Academy of Pediatrics issued its first statement on homosexuality and adolescents in 1983, with a revision in 1993. This report reflects the growing understanding of youth of differing sexual orientations. Young people are recognizing their sexual orientation earlier than in the past, making this a topic of importance to pediatricians. Pediatricians should be aware that some youths in their care may have concerns about their sexual orientation or that of siblings, friends, parents, relatives, or others. Health care professionals should provide factual, current, nonjudgmental information in a confidential manner. All youths, including those who know or wonder whether they are not heterosexual, may seek information from physicians about sexual orientation, sexually transmitted diseases, substance abuse, or various psychosocial difficulties. The pediatrician should be attentive to various potential psychosocial difficulties, offer counseling or refer for counseling when necessary and ensure that every sexually active youth receives a thorough medical history, physical examination, immunizations, appropriate laboratory tests, and counseling about sexually transmitted diseases (including human immunodeficiency virus infection) and appropriate treatment if necessary.

Not all pediatricians may feel able to provide the type of care described in this report. Any pediatrician who is unable to care for and counsel nonheterosexual youth should refer these patients to an appropriate colleague. (6/04)

SEXUALITY, CONTRACEPTION, AND THE MEDIA

Victor C. Strasburger, MD, and Council on Communications and Media

ABSTRACT. From a health viewpoint, early sexual activity among US adolescents is a potential problem because of the risk of pregnancy and sexually transmitted infec-

tions. New evidence points to the media adolescents use frequently (television, music, movies, magazines, and the Internet) as important factors in the initiation of sexual intercourse. There is a major disconnect between what mainstream media portray—casual sex and sexuality with no consequences—and what children and teenagers need—straightforward information about human sexuality and the need for contraception when having sex. Television, film, music, and the Internet are all becoming increasingly sexually explicit, yet information on abstinence, sexual responsibility, and birth control remains rare. It is unwise to promote “abstinence-only” sex education when it has been shown to be ineffective and when the media have become such an important source of information about “nonabstinence.” Recommendations are presented to help pediatricians address this important issue. (8/10)

SEXUALITY EDUCATION FOR CHILDREN AND ADOLESCENTS

Committee on Psychosocial Aspects of Child and Family Health and Committee on Adolescence

ABSTRACT. Children and adolescents need accurate and comprehensive education about sexuality to practice healthy sexual behavior as adults. Early, exploitative, or risky sexual activity may lead to health and social problems, such as unintended pregnancy and sexually transmitted diseases, including human immunodeficiency virus infection and acquired immunodeficiency syndrome. This statement reviews the role of the pediatrician in providing sexuality education to children, adolescents, and their families. Pediatricians should integrate sexuality education into the confidential and longitudinal relationship they develop with children, adolescents, and families to complement the education children obtain at school and at home. Pediatricians must be aware of their own attitudes, beliefs, and values so their effectiveness in discussing sexuality in the clinical setting is not limited. (8/01, reaffirmed 10/04)

SEXUALITY OF CHILDREN AND ADOLESCENTS WITH DEVELOPMENTAL DISABILITIES (CLINICAL REPORT)

Nancy A. Murphy, MD; Ellen Roy Elias, MD; for Council on Children With Disabilities

ABSTRACT. Children and adolescents with developmental disabilities, like all children, are sexual persons. However, attention to their complex medical and functional issues often consumes time that might otherwise be invested in addressing the anatomic, physiologic, emotional, and social aspects of their developing sexuality. This report discusses issues of puberty, contraception, psychosexual development, sexual abuse, and sexuality education specific to children and adolescents with disabilities and their families. Pediatricians, in the context of the medical home, are encouraged to discuss issues of sexuality on a regular basis, ensure the privacy of each child and adolescent, promote self-care and social independence among persons with disabilities, advocate for appropriate sexuality education, and provide ongoing education for children and adolescents with developmental disabilities and their families. (7/06, reaffirmed 12/09, 7/13)

SHOPPING CART-RELATED INJURIES TO CHILDREN

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Shopping cart-related injuries to children are common and can result in severe injury or even death. Most injuries result from falls from carts or cart tip-overs, and injuries to the head and neck represent three fourths of cases. The current US standard for shopping carts should be revised to include clear and effective performance criteria to prevent falls from carts and cart tipovers. Pediatricians have an important role as educators, researchers, and advocates to promote the prevention of these injuries. (8/06, reaffirmed 4/09, 8/13)

SHOPPING CART-RELATED INJURIES TO CHILDREN (TECHNICAL REPORT)

Gary A. Smith, MD, DrPH, for Committee on Injury, Violence, and Poison Prevention

ABSTRACT. An estimated 24 200 children younger than 15 years, 20 700 (85%) of whom were younger than 5 years, were treated in US hospital emergency departments in 2005 for shopping cart-related injuries. Approximately 4% of shopping cart-related injuries to children younger than 15 years require admission to the hospital. Injuries to the head and neck represent three fourths of all injuries. Fractures account for 45% of all hospitalizations. Deaths have occurred from falls from shopping carts and cart tip-overs. Falls are the most common mechanism of injury and account for more than half of injuries associated with shopping carts. Cart tip-overs are the second most common mechanism, responsible for up to one fourth of injuries and almost 40% of shopping cart-related injuries among children younger than 2 years. Public-awareness initiatives, education programs, and parental supervision, although important, are not enough to prevent these injuries effectively. European Standard EN 1929-1:1998 and joint Australian/New Zealand Standard AS/NZS 3847.1:1999 specify requirements for the construction, performance, testing, and safety of shopping carts and have been implemented as national standards in 21 countries. A US performance standard for shopping carts (ASTM [American Society for Testing and Materials] F2372-04) was established in July 2004; however, it does not adequately address falls and cart tip-overs, which are the leading mechanisms of shopping cart-related injuries to children. The current US standard for shopping carts should be revised to include clear and effective performance criteria for shopping cart child-restraint systems and cart stability to prevent falls from carts and cart tip-overs. This is imperative to decrease the number and severity of shopping cart-related injuries to children. Recommendations from the American Academy of Pediatrics regarding prevention of shopping cart-related injuries are included in the accompanying policy statement. (8/06, reaffirmed 4/09, 8/13)

SIDS AND OTHER SLEEP-RELATED INFANT DEATHS: EXPANSION OF RECOMMENDATIONS FOR A SAFE INFANT SLEEPING ENVIRONMENT

Task Force on Sudden Infant Death Syndrome

ABSTRACT. Despite a major decrease in the incidence of sudden infant death syndrome (SIDS) since the American Academy of Pediatrics (AAP) released its recommenda-

tion in 1992 that infants be placed for sleep in a non-prone position, this decline has plateaued in recent years. Concurrently, other causes of sudden unexpected infant death that occur during sleep (sleep-related deaths), including suffocation, asphyxia, and entrapment, and ill-defined or unspecified causes of death have increased in incidence, particularly since the AAP published its last statement on SIDS in 2005. It has become increasingly important to address these other causes of sleep-related infant death. Many of the modifiable and nonmodifiable risk factors for SIDS and suffocation are strikingly similar. The AAP, therefore, is expanding its recommendations from focusing only on SIDS to focusing on a safe sleep environment that can reduce the risk of all sleep-related infant deaths, including SIDS. The recommendations described in this policy statement include supine positioning, use of a firm sleep surface, breastfeeding, room-sharing without bed-sharing, routine immunizations, consideration of using a pacifier, and avoidance of soft bedding, overheating, and exposure to tobacco smoke, alcohol, and illicit drugs. The rationale for these recommendations is discussed in detail in the accompanying "Technical Report—SIDS and Other Sleep-Related Infant Deaths: Expansion of Recommendations for a Safe Infant Sleeping Environment." (10/11)

**SIDS AND OTHER SLEEP-RELATED INFANT DEATHS:
EXPANSION OF RECOMMENDATIONS FOR A SAFE
INFANT SLEEPING ENVIRONMENT (TECHNICAL REPORT)**

Task Force on Sudden Infant Death Syndrome

ABSTRACT. Despite a major decrease in the incidence of sudden infant death syndrome (SIDS) since the American Academy of Pediatrics (AAP) released its recommendation in 1992 that infants be placed for sleep in a non-prone position, this decline has plateaued in recent years. Concurrently, other causes of sudden unexpected infant death occurring during sleep (sleep-related deaths), including suffocation, asphyxia, and entrapment, and ill-defined or unspecified causes of death have increased in incidence, particularly since the AAP published its last statement on SIDS in 2005. It has become increasingly important to address these other causes of sleep-related infant death. Many of the modifiable and nonmodifiable risk factors for SIDS and suffocation are strikingly similar. The AAP, therefore, is expanding its recommendations from being only SIDS-focused to focusing on a safe sleep environment that can reduce the risk of all sleep-related infant deaths including SIDS. The recommendations described in this report include supine positioning, use of a firm sleep surface, breastfeeding, room-sharing without bed-sharing, routine immunization, consideration of a pacifier, and avoidance of soft bedding, overheating, and exposure to tobacco smoke, alcohol, and illicit drugs. The rationale for these recommendations is discussed in detail in this technical report. The recommendations are published in the accompanying "Policy Statement—Sudden Infant Death Syndrome and Other Sleep-Related Infant Deaths: Expansion of Recommendations for a Safe Infant Sleeping Environment." (10/11)

SKATEBOARD AND SCOOTER INJURIES

Committee on Injury, Violence, and Poison Prevention

ABSTRACT. Skateboard-related injuries account for an estimated 50 000 emergency department visits and 1500 hospitalizations among children and adolescents in the United States each year. Nonpowered scooter-related injuries accounted for an estimated 9400 emergency department visits between January and August 2000, and 90% of these patients were children younger than 15 years. Many such injuries can be avoided if children and youth do not ride in traffic, if proper protective gear is worn, and if, in the absence of close adult supervision, skateboards and scooters are not used by children younger than 10 and 8 years, respectively. (3/02, reaffirmed 5/05, 10/08, 10/13)

SNOWMOBILING HAZARDS

Committee on Injury and Poison Prevention

ABSTRACT. Snowmobiles continue to pose a significant risk to children younger than 15 years and adolescents and young adults 15 through 24 years of age. Head injuries remain the leading cause of mortality and serious morbidity, arising largely from snowmobilers colliding, falling, or overturning during operation. Children also were injured while being towed in a variety of conveyances by snowmobiles. No uniform code of state laws governs the use of snowmobiles by children and youth. Because evidence is lacking to support the effectiveness of operator safety certification and because many children and adolescents do not have the required strength and skills to operate a snowmobile safely, the recreational operation of snowmobiles by persons younger than 16 years is not recommended. Snowmobiles should not be used to tow persons on a tube, tire, sled, or saucer. Furthermore, a graduated licensing program is advised for snowmobilers 16 years and older. Both active and passive snowmobile injury prevention strategies are suggested, as well as recommendations for manufacturers to make safer equipment for snowmobilers of all ages. (11/00, reaffirmed 5/04, 1/07, 6/10)

SOFT DRINKS IN SCHOOLS

Committee on School Health

ABSTRACT. This statement is intended to inform pediatricians and other health care professionals, parents, superintendents, and school board members about nutritional concerns regarding soft drink consumption in schools. Potential health problems associated with high intake of sweetened drinks are 1) overweight or obesity attributable to additional calories in the diet; 2) displacement of milk consumption, resulting in calcium deficiency with an attendant risk of osteoporosis and fractures; and 3) dental caries and potential enamel erosion. Contracts with school districts for exclusive soft drink rights encourage consumption directly and indirectly. School officials and parents need to become well informed about the health implications of vended drinks in school before making a decision about student access to them. A clearly defined, district-wide policy that restricts the sale of soft drinks will safeguard against health problems as a result of overconsumption. (1/04, reaffirmed 1/09)

SPECIAL REQUIREMENTS OF ELECTRONIC HEALTH RECORD SYSTEMS IN PEDIATRICS (CLINICAL REPORT)

S. Andrew Spooner, MD, MS, and Council on Clinical Information Technology

ABSTRACT. Some functions of an electronic health record system are much more important in providing pediatric care than in adult care. Pediatricians commonly complain about the absence of these “pediatric functions” when they are not available in electronic health record systems. To stimulate electronic health record system vendors to recognize and incorporate pediatric functionality into pediatric electronic health record systems, this clinical report reviews the major functions of importance to child health care providers. Also reviewed are important but less critical functions, any of which might be of major importance in a particular clinical context. The major areas described here are immunization management, growth tracking, medication dosing, data norms, and privacy in special pediatric populations. The American Academy of Pediatrics believes that if the functions described in this document are supported in all electronic health record systems, these systems will be more useful for patients of all ages. (3/07, reaffirmed 5/12)

SPECTRUM OF NONINFECTIOUS HEALTH EFFECTS FROM MOLDS

Committee on Environmental Health

ABSTRACT. Molds are eukaryotic (possessing a true nucleus) nonphotosynthetic organisms that flourish both indoors and outdoors. For humans, the link between mold exposure and asthma exacerbations, allergic rhinitis, infections, and toxicities from ingestion of mycotoxin-contaminated foods are well known. However, the cause-and-effect relationship between inhalational exposure to mold and other untoward health effects (eg, acute idiopathic pulmonary hemorrhage in infants and other illnesses and health complaints) requires additional investigation. Pediatricians play an important role in the education of families about mold, its adverse health effects, exposure prevention, and remediation procedures. (12/06, reaffirmed 1/11)

SPECTRUM OF NONINFECTIOUS HEALTH EFFECTS FROM MOLDS (TECHNICAL REPORT)

Lynnette J. Mazur, MD, MPH; Janice Kim, MD, PhD, MPH; and Committee on Environmental Health

ABSTRACT. Molds are multicellular fungi that are ubiquitous in outdoor and indoor environments. For humans, they are both beneficial (for the production of antimicrobial agents, chemotherapeutic agents, and vitamins) and detrimental. Exposure to mold can occur through inhalation, ingestion, and touching moldy surfaces. Adverse health effects may occur through allergic, infectious, irritant, or toxic processes. The cause-and-effect relationship between mold exposure and allergic and infectious illnesses is well known. Exposures to toxins via the gastrointestinal tract also are well described. However, the cause-and-effect relationship between inhalational exposure to mold toxins and other untoward health effects (eg, acute idiopathic pulmonary hemorrhage in infants and other illnesses and health complaints) is controversial and requires additional investigation. In this report we exam-

ine evidence of fungal-related illnesses and the unique aspects of mold exposure to children. Mold-remediation procedures are also discussed. (12/06, reaffirmed 1/11)

SPORT-RELATED CONCUSSION IN CHILDREN AND ADOLESCENTS (CLINICAL REPORT)

Mark E. Halstead, MD; Kevin D. Walter, MD; and Council on Sports Medicine and Fitness

ABSTRACT. Sport-related concussion is a “hot topic” in the media and in medicine. It is a common injury that is likely underreported by pediatric and adolescent athletes. Football has the highest incidence of concussion, but girls have higher concussion rates than boys do in similar sports. A clear understanding of the definition, signs, and symptoms of concussion is necessary to recognize it and rule out more severe intracranial injury. Concussion can cause symptoms that interfere with school, social and family relationships, and participation in sports. Recognition and education are paramount, because although proper equipment, sport technique, and adherence to rules of the sport may decrease the incidence or severity of concussions, nothing has been shown to prevent them. Appropriate management is essential for reducing the risk of long-term symptoms and complications. Cognitive and physical rest is the mainstay of management after diagnosis, and neuropsychological testing is a helpful tool in the management of concussion. Return to sport should be accomplished by using a progressive exercise program while evaluating for any return of signs or symptoms. This report serves as a basis for understanding the diagnosis and management of concussion in children and adolescent athletes. (8/10, reaffirmed 8/14)

SPORTS DRINKS AND ENERGY DRINKS FOR CHILDREN AND ADOLESCENTS: ARE THEY APPROPRIATE? (CLINICAL REPORT)

Committee on Nutrition and Council on Sports Medicine and Fitness

ABSTRACT. Sports and energy drinks are being marketed to children and adolescents for a wide variety of inappropriate uses. Sports drinks and energy drinks are significantly different products, and the terms should not be used interchangeably. The primary objectives of this clinical report are to define the ingredients of sports and energy drinks, categorize the similarities and differences between the products, and discuss misuses and abuses. Secondary objectives are to encourage screening during annual physical examinations for sports and energy drink use, to understand the reasons why youth consumption is widespread, and to improve education aimed at decreasing or eliminating the inappropriate use of these beverages by children and adolescents. Rigorous review and analysis of the literature reveal that caffeine and other stimulant substances contained in energy drinks have no place in the diet of children and adolescents. Furthermore, frequent or excessive intake of caloric sports drinks can substantially increase the risk for overweight or obesity in children and adolescents. Discussion regarding the appropriate use of sports drinks in the youth athlete who participates regularly in endurance or high-intensity sports and vigorous physical activity is beyond the scope of this report. (5/11)

STANDARD TERMINOLOGY FOR FETAL, INFANT, AND PERINATAL DEATHS (CLINICAL REPORT)

CAPT Wanda Denise Barfield, MD, MPH, and Committee on Fetus and Newborn

ABSTRACT. Accurately defining and reporting perinatal deaths (ie, fetal and infant deaths) is a critical first step in understanding the magnitude and causes of these important events. In addition to obstetric health care providers, neonatologists and pediatricians should know the current US definitions and reporting requirements for live births, fetal deaths, and infant deaths. Correct identification of these vital events will improve our local, state, and national data so that these deaths can be better addressed and reduced. (6/11)

STANDARDS FOR HEALTH INFORMATION TECHNOLOGY TO ENSURE ADOLESCENT PRIVACY

Committee on Adolescence and Council on Clinical Information Technology

ABSTRACT. Privacy and security of health information is a basic expectation of patients. Despite the existence of federal and state laws safeguarding the privacy of health information, health information systems currently lack the capability to allow for protection of this information for minors. This policy statement reviews the challenges to privacy for adolescents posed by commercial health information technology systems and recommends basic principles for ideal electronic health record systems. This policy statement has been endorsed by the Society for Adolescent Health and Medicine. (10/12)

STANDARDS FOR PEDIATRIC CANCER CENTERS

Section on Hematology/Oncology

ABSTRACT. Since the American Academy of Pediatrics published guidelines for pediatric cancer centers in 1986, 1997, and 2004, significant changes in the delivery of health care have prompted a review of the role of medical centers in the care of pediatric patients. The potential effect of these changes on the treatment and survival rates of children with cancer led to this revision. The intent of this statement is to delineate personnel, capabilities, and facilities that are essential to provide state-of-the-art care for children, adolescents, and young adults with cancer. This statement emphasizes the importance of board-certified pediatric hematologists/oncologists and appropriately qualified pediatric medical subspecialists and pediatric surgical specialists overseeing patient care and the need for specialized facilities as essential for the initial management and much of the follow-up for pediatric, adolescent, and young adult patients with cancer. For patients without practical access to a pediatric cancer center, care may be provided locally by a primary care physician or adult oncologist but at the direction of a pediatric oncologist. (7/14)

See full on text on page 997.

STATE CHILDREN'S HEALTH INSURANCE PROGRAM ACHIEVEMENTS, CHALLENGES, AND POLICY RECOMMENDATIONS

Committee on Child Health Financing

ABSTRACT. This policy statement reviews the impressive progress of the State Children's Health Insurance Program since its enactment in 1997 and identifies outstanding

challenges and state and federal policy recommendations. The American Academy of Pediatrics urges Congress to reauthorize SCHIP to strengthen its historic gains. The following set of recommended strategies for reauthorization pertain to funding, eligibility and enrollment, coverage, cost sharing, payment and provider-network capacity, and quality performance. (6/07)

STRATEGIES FOR PREVENTION OF HEALTH CARE-ASSOCIATED INFECTIONS IN THE NICU (CLINICAL REPORT)

Richard A. Polin, MD; Susan Denson, MD; Michael T. Brady, MD; Committee on Fetus and Newborn; and Committee on Infectious Diseases

ABSTRACT. Health care-associated infections in the NICU result in increased morbidity and mortality, prolonged lengths of stay, and increased medical costs. Neonates are at high risk of acquiring health care-associated infections because of impaired host-defense mechanisms, limited amounts of protective endogenous flora on skin and mucosal surfaces at time of birth, reduced barrier function of their skin, use of invasive procedures and devices, and frequent exposure to broad-spectrum antibiotic agents. This clinical report reviews management and prevention of health care-associated infections in newborn infants. (3/12)

STRENGTH TRAINING BY CHILDREN AND ADOLESCENTS

Council on Sports Medicine and Fitness

ABSTRACT. Pediatricians are often asked to give advice on the safety and efficacy of strength-training programs for children and adolescents. This statement, which is a revision of a previous American Academy of Pediatrics policy statement, defines relevant terminology and provides current information on risks and benefits of strength training for children and adolescents. (4/08, reaffirmed 6/11)

SUBSTANCE USE SCREENING, BRIEF INTERVENTION, AND REFERRAL TO TREATMENT FOR PEDIATRICIANS

Committee on Substance Abuse

ABSTRACT. As a component of comprehensive pediatric care, adolescents should receive appropriate guidance regarding substance use during routine clinical care. This statement addresses practitioner challenges posed by the spectrum of pediatric substance use and presents an algorithm-based approach to augment the pediatrician's confidence and abilities related to substance use screening, brief intervention, and referral to treatment in the primary care setting. Adolescents with addictions should be managed collaboratively (or comanaged) with child and adolescent mental health or addiction specialists. This statement reviews recommended referral guidelines that are based on established patient-treatment-matching criteria and the risk level for substance abuse. (10/11)

SUICIDE AND SUICIDE ATTEMPTS IN ADOLESCENTS (CLINICAL REPORT)

Benjamin N. Shain, MD, PhD, and Committee on Adolescence

ABSTRACT. Suicide is the third-leading cause of death for adolescents 15 to 19 years old. Pediatricians can take steps to help reduce the incidence of adolescent suicide by

screening for depression and suicidal ideation and behavior. This report updates the previous statement of the American Academy of Pediatrics and is intended to assist the pediatrician in the identification and management of the adolescent at risk of suicide. The extent to which pediatricians provide appropriate care for suicidal adolescents depends on their knowledge, skill, comfort with the topic, and ready access to appropriate community resources. All teenagers with suicidal thoughts or behaviors should know that their pleas for assistance are heard and that pediatricians are willing to serve as advocates to help resolve the crisis. (9/07)

SUPPLEMENTAL SECURITY INCOME (SSI) FOR CHILDREN AND YOUTH WITH DISABILITIES

Council on Children With Disabilities

ABSTRACT. The Supplemental Security Income (SSI) program remains an important source of financial support for low-income families of children with special health care needs and disabling conditions. In most states, SSI eligibility also qualifies children for the state Medicaid program, providing access to health care services. The Social Security Administration (SSA), which administers the SSI program, considers a child disabled under SSI if there is a medically determinable physical or mental impairment or combination of impairments that results in marked and severe functional limitations. The impairment(s) must be expected to result in death or have lasted or be expected to last for a continuous period of at least 12 months. The income and assets of families of children with disabilities are also considered when determining financial eligibility. When an individual with a disability becomes an adult at 18 years of age, the SSA considers only the individual's income and assets. The SSA considers an adult to be disabled if there is a medically determinable impairment (or combination of impairments) that prevents substantial gainful activity for at least 12 continuous months. SSI benefits are important for youth with chronic conditions who are transitioning to adulthood. The purpose of this statement is to provide updated information about the SSI medical and financial eligibility criteria and the disability-determination process. This statement also discusses how pediatricians can help children and youth when they apply for SSI benefits. (11/09)

SUPPORTING THE FAMILY AFTER THE DEATH OF A CHILD (CLINICAL REPORT)

Esther Wender, MD, and Committee on Psychosocial Aspects of Child and Family Health

ABSTRACT. The death of a child can have a devastating effect on the family. The pediatrician has an important role to play in supporting the parents and any siblings still in his or her practice after such a death. Pediatricians may be poorly prepared to provide this support. Also, because of the pain of confronting the grief of family members, they may be reluctant to become involved. This statement gives guidelines to help the pediatrician provide such support. It describes the grief reactions that can be expected in family members after the death of a child. Ways of supporting family members are suggested, and other helpful resources in the community are described. The goal of this guidance is to prevent outcomes that may impair the

health and development of affected parents and children. (11/12)

SUPPORTING THE HEALTH CARE TRANSITION FROM ADOLESCENCE TO ADULTHOOD IN THE MEDICAL HOME (CLINICAL REPORT)

American Academy of Pediatrics, American Academy of Family Physicians, and American College of Physicians Transitions Clinical Report Authoring Group

ABSTRACT. Optimal health care is achieved when each person, at every age, receives medically and developmentally appropriate care. The goal of a planned health care transition is to maximize lifelong functioning and well-being for all youth, including those who have special health care needs and those who do not. This process includes ensuring that high-quality, developmentally appropriate health care services are available in an uninterrupted manner as the person moves from adolescence to adulthood. A well-timed transition from child- to adult-oriented health care is specific to each person and ideally occurs between the ages of 18 and 21 years. Coordination of patient, family, and provider responsibilities enables youth to optimize their ability to assume adult roles and activities. This clinical report represents expert opinion and consensus on the practice-based implementation of transition for all youth beginning in early adolescence. It provides a structure for training and continuing education to further understanding of the nature of adolescent transition and how best to support it. Primary care physicians, nurse practitioners, and physician assistants, as well as medical subspecialists, are encouraged to adopt these materials and make this process specific to their settings and populations. (7/11)

SURFACTANT REPLACEMENT THERAPY FOR PRETERM AND TERM NEONATES WITH RESPIRATORY DISTRESS (CLINICAL REPORT)

Richard A. Polin, MD, FAAP; Waldemar A. Carlo, MD, FAAP; and Committee on Fetus and Newborn

ABSTRACT. Respiratory failure secondary to surfactant deficiency is a major cause of morbidity and mortality in preterm infants. Surfactant therapy substantially reduces mortality and respiratory morbidity for this population. Secondary surfactant deficiency also contributes to acute respiratory morbidity in late-preterm and term neonates with meconium aspiration syndrome, pneumonia/sepsis, and perhaps pulmonary hemorrhage; surfactant replacement may be beneficial for these infants. This statement summarizes the evidence regarding indications, administration, formulations, and outcomes for surfactant-replacement therapy. The clinical strategy of intubation, surfactant administration, and extubation to continuous positive airway pressure and the effect of continuous positive airway pressure on outcomes and surfactant use in preterm infants are also reviewed. (12/13)

SURVEILLANCE OF PEDIATRIC HIV INFECTION

Committee on Pediatric AIDS

ABSTRACT. Pediatric human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) surveillance should expand to include perinatal HIV exposure and HIV infection as well as AIDS to delineate

completely the extent and impact of HIV infection on children and families, accurately assess the resources necessary to provide services to this population, evaluate the efficacy of public health recommendations, and determine any potential long-term consequences of interventions to prevent perinatal transmission to children ultimately determined to be uninfected as well as for those who become infected. Ensuring the confidentiality of information collected in the process of surveillance is critical. In addition, expansion of surveillance must not compromise the established, ongoing surveillance system for pediatric AIDS. An expanded pediatric HIV surveillance program provides an important counterpart to existing American Academy of Pediatrics and American College of Obstetricians and Gynecologists recommendations for HIV counseling and testing in the prenatal setting. (2/98, reaffirmed 2/02, 1/06, 1/11)

THE TEEN DRIVER

Committee on Injury, Violence, and Poison Prevention and Committee on Adolescence

ABSTRACT. Motor vehicle–related injuries to adolescents continue to be of paramount importance to society. Since the original policy statement on the teenaged driver was published in 1996, there have been substantial changes in many state laws and much new research on this topic. There is a need to provide pediatricians with up-to-date information and materials to facilitate appropriate counseling and anticipatory guidance. This statement describes why teenagers are at greater risk of motor vehicle–related injuries, suggests topics suitable for office-based counseling, describes innovative programs, and proposes preventive interventions for pediatricians, parents, legislators, educators, and other child advocates. (12/06, reaffirmed 6/10)

TESTING FOR DRUGS OF ABUSE IN CHILDREN AND ADOLESCENTS (CLINICAL REPORT)

Sharon Levy, MD, MPH, FAAP; Lorena M. Siqueira, MD, MSPH, FAAP; and Committee on Substance Abuse

ABSTRACT. Drug testing is often used as part of an assessment for substance use in children and adolescents. However, the indications for drug testing and guidance on how to use this procedure effectively are not clear. The complexity and invasiveness of the procedure and limitations to the information derived from drug testing all affect its utility. The objective of this clinical report is to provide guidance to pediatricians and other clinicians on the efficacy and efficient use of drug testing on the basis of a review of the nascent scientific literature, policy guidelines, and published clinical recommendations. (5/14)

See full text on page 1005.

TOBACCO, ALCOHOL, AND OTHER DRUGS: THE ROLE OF THE PEDIATRICIAN IN PREVENTION, IDENTIFICATION, AND MANAGEMENT OF SUBSTANCE ABUSE (CLINICAL REPORT)

John W. Kulig, MD, MPH, and Committee on Substance Abuse

ABSTRACT. Substance abuse remains a major public health concern, and pediatricians are uniquely positioned to assist their patients and families with its prevention, detection, and treatment. The American Academy of

Pediatrics has highlighted the importance of such issues in a variety of ways, including its guidelines for preventive services. The harmful consequences of tobacco, alcohol, and other drug use are a concern of medical professionals who care for infants, children, adolescents, and young adults. Thus, pediatricians should include discussion of substance abuse as a part of routine health care, starting with the prenatal visit, and as part of ongoing anticipatory guidance. Knowledge of the nature and extent of the consequences of tobacco, alcohol, and other drug use as well as the physical, psychological, and social consequences is essential for pediatricians. Pediatricians should incorporate substance-abuse prevention into daily practice, acquire the skills necessary to identify young people at risk of substance abuse, and provide or facilitate assessment, intervention, and treatment as necessary. (3/05, reaffirmed 3/13)

TOBACCO AS A SUBSTANCE OF ABUSE (TECHNICAL REPORT)

Tammy H. Sims, MD, MS, and Committee on Substance Abuse

ABSTRACT. Tobacco use is the leading preventable cause of morbidity and death in the United States. Because 80% to 90% of adult smokers began during adolescence, and two thirds became regular, daily smokers before they reached 19 years of age, tobacco use may be viewed as a pediatric disease. Every year in the United States, approximately 1.4 million children younger than 18 years start smoking, and many of them will die prematurely from a smoking-related disease. Moreover, there is recent evidence that adolescents report symptoms of tobacco dependence early in the smoking process, even before becoming daily smokers. The prevalence of tobacco use is higher among teenagers and young adults than among older adult populations. The critical role of pediatricians in helping to reduce tobacco use and addiction and secondhand tobacco-smoke exposure in the pediatric population includes education and prevention, screening and detection, and treatment and referral. (10/09)

TOBACCO USE: A PEDIATRIC DISEASE

Committee on Environmental Health, Committee on Substance Abuse, Committee on Adolescence, and Committee on Native American Child Health

ABSTRACT. Tobacco use and secondhand tobacco-smoke (SHS) exposure are major national and international health concerns. Pediatricians and other clinicians who care for children are uniquely positioned to assist patients and families with tobacco-use prevention and treatment. Understanding the nature and extent of tobacco use and SHS exposure is an essential first step toward the goal of eliminating tobacco use and its consequences in the pediatric population. The next steps include counseling patients and family members to avoid SHS exposures or cease tobacco use; advocacy for policies that protect children from SHS exposure; and elimination of tobacco use in the media, public places, and homes. Three overarching principles of this policy can be identified: (1) there is no safe way to use tobacco; (2) there is no safe level or duration of exposure to SHS; and (3) the financial and political power of individuals, organizations, and government should be

used to support tobacco control. Pediatricians are advised not to smoke or use tobacco; to make their homes, cars, and workplaces tobacco free; to consider tobacco control when making personal and professional decisions; to support and advocate for comprehensive tobacco control; and to advise parents and patients not to start using tobacco or to quit if they are already using tobacco. Prohibiting both tobacco advertising and the use of tobacco products in the media is recommended. Recommendations for eliminating SHS exposure and reducing tobacco use include attaining universal (1) smoke-free home, car, school, work, and play environments, both inside and outside, (2) treatment of tobacco use and dependence through employer, insurance, state, and federal supports, (3) implementation and enforcement of evidence-based tobacco-control measures in local, state, national, and international jurisdictions, and (4) financial and systems support for training in and research of effective ways to prevent and treat tobacco use and SHS exposure. Pediatricians, their staff and colleagues, and the American Academy of Pediatrics have key responsibilities in tobacco control to promote the health of children, adolescents, and young adults. (10/09, reaffirmed 5/13)

TOWARD TRANSPARENT CLINICAL POLICIES

Steering Committee on Quality Improvement and Management

ABSTRACT. Clinical policies of professional societies such as the American Academy of Pediatrics are valued highly, not only by clinicians who provide direct health care to children but also by many others who rely on the professional expertise of these organizations, including parents, employers, insurers, and legislators. The utility of a policy depends, in large part, on the degree to which its purpose and basis are clear to policy users, an attribute known as the policy's transparency. This statement describes the critical importance and special value of transparency in clinical policies, guidelines, and recommendations; helps identify obstacles to achieving transparency; and suggests several approaches to overcome these obstacles. (3/08, reaffirmed 2/14)

TRAMPOLINE SAFETY IN CHILDHOOD AND ADOLESCENCE

Council on Sports Medicine and Fitness

ABSTRACT. Despite previous recommendations from the American Academy of Pediatrics discouraging home use of trampolines, recreational use of trampolines in the home setting continues to be a popular activity among children and adolescents. This policy statement is an update to previous statements, reflecting the current literature on prevalence, patterns, and mechanisms of trampoline-related injuries. Most trampoline injuries occur with multiple simultaneous users on the mat. Cervical spine injuries often occur with falls off the trampoline or with attempts at somersaults or flips. Studies on the efficacy of trampoline safety measures are reviewed, and although there is a paucity of data, current implementation of safety measures have not appeared to mitigate risk substantially. Therefore, the home use of trampolines is strongly discouraged. The role of trampoline as a competitive sport and in structured training settings is reviewed,

and recommendations for enhancing safety in these environments are made. (9/12)

THE TRANSFER OF DRUGS AND THERAPEUTICS INTO HUMAN BREAST MILK: AN UPDATE ON SELECTED TOPICS (CLINICAL REPORT)

Hari Cheryl Sachs, MD, FAAP, and Committee on Drugs

ABSTRACT. Many mothers are inappropriately advised to discontinue breastfeeding or avoid taking essential medications because of fears of adverse effects on their infants. This cautious approach may be unnecessary in many cases, because only a small proportion of medications are contraindicated in breastfeeding mothers or associated with adverse effects on their infants. Information to inform physicians about the extent of excretion for a particular drug into human milk is needed but may not be available. Previous statements on this topic from the American Academy of Pediatrics provided physicians with data concerning the known excretion of specific medications into breast milk. More current and comprehensive information is now available on the Internet, as well as an application for mobile devices, at LactMed (<http://toxnet.nlm.nih.gov>). Therefore, with the exception of radioactive compounds requiring temporary cessation of breastfeeding, the reader will be referred to LactMed to obtain the most current data on an individual medication. This report discusses several topics of interest surrounding lactation, such as the use of psychotropic therapies, drugs to treat substance abuse, narcotics, galactagogues, and herbal products, as well as immunization of breastfeeding women. A discussion regarding the global implications of maternal medications and lactation in the developing world is beyond the scope of this report. The World Health Organization offers several programs and resources that address the importance of breastfeeding (see <http://www.who.int/topics/breastfeeding/en/>). (8/13)

TRANSITIONING HIV-INFECTED YOUTH INTO ADULT HEALTH CARE

Committee on Pediatric AIDS

ABSTRACT. With advances in antiretroviral therapy, most HIV-infected children survive into adulthood. Optimal health care for these youth includes a formal plan for the transition of care from primary and/or subspecialty pediatric/adolescent/family medicine health care providers (medical home) to adult health care provider(s). Successful transition involves the early engagement and participation of the youth and his or her family with the pediatric medical home and adult health care teams in developing a formal plan. Referring providers should have a written policy for the transfer of HIV-infected youth to adult care, which will guide in the development of an individualized plan for each youth. The plan should be introduced to the youth in early adolescence and modified as the youth approaches transition. Assessment of developmental milestones is important to define the readiness of the youth in assuming responsibility for his or her own care before initiating the transfer. Communication among all providers is essential and should include both personal contact and a written medical summary. Progress toward the transition should be tracked and, once completed, should be documented and assessed. (6/13)

TRANSPORTING CHILDREN WITH SPECIAL HEALTH CARE NEEDS

Committee on Injury and Poison Prevention

ABSTRACT. Children with special health care needs should have access to proper resources for safe transportation. This statement reviews important considerations for transporting children with special health care needs and provides current guidelines for the protection of children with specific health care needs, including those with a tracheostomy, a spica cast, challenging behaviors, or muscle tone abnormalities as well as those transported in wheelchairs. (10/99, reaffirmed 1/03, 1/06, 3/13)

THE TREATMENT OF NEUROLOGICALLY IMPAIRED CHILDREN USING PATTERNING

Committee on Children With Disabilities

ABSTRACT. This statement reviews patterning as a treatment for children with neurologic impairments. This treatment is based on an outmoded and oversimplified theory of brain development. Current information does not support the claims of proponents that this treatment is efficacious, and its use continues to be unwarranted. (11/99, reaffirmed 11/02, 1/06, 8/10, 4/14)

ULTRAVIOLET RADIATION: A HAZARD TO CHILDREN AND ADOLESCENTS

Council on Environmental Health and Section on Dermatology

ABSTRACT. Ultraviolet radiation (UVR) causes the 3 major forms of skin cancer: basal cell carcinoma; squamous cell carcinoma; and cutaneous malignant melanoma. Public awareness of the risk is not optimal, overall compliance with sun protection is inconsistent, and melanoma rates continue to rise. The risk of skin cancer increases when people overexpose themselves to sun and intentionally expose themselves to artificial sources of UVR. Yet, people continue to sunburn, and teenagers and adults alike remain frequent visitors to tanning parlors. Pediatricians should provide advice about UVR exposure during health-supervision visits and at other relevant times. Advice includes avoiding sunburning, wearing clothing and hats, timing activities (when possible) before or after periods of peak sun exposure, wearing protective sunglasses, and applying and reapplying sunscreen. Advice should be framed in the context of promoting outdoor physical activity. Adolescents should be strongly discouraged from visiting tanning parlors. Sun exposure and vitamin D status are intertwined. Cutaneous vitamin D production requires sunlight exposure, and many factors, such as skin pigmentation, season, and time of day, complicate efficiency of cutaneous vitamin D production that results from sun exposure. Adequate vitamin D is needed for bone health. Accumulating information suggests a beneficial influence of vitamin D on many health conditions. Although vitamin D is available through the diet, supplements, and incidental sun exposure, many children have low vitamin D concentrations. Ensuring vitamin D adequacy while promoting sun-protection strategies will require renewed attention to children's use of dietary and supplemental vitamin D. (2/11)

ULTRAVIOLET RADIATION: A HAZARD TO CHILDREN AND ADOLESCENTS (TECHNICAL REPORT)

Sophie J. Balk, MD, Council on Environmental Health, and Section on Dermatology

ABSTRACT. Sunlight sustains life on earth. Sunlight is essential for vitamin D synthesis in the skin. The sun's ultraviolet rays can be hazardous, however, because excessive exposure causes skin cancer and other adverse health effects. Skin cancer is a major public health problem; more than 2 million new cases are diagnosed in the United States each year. Ultraviolet radiation (UVR) causes the 3 major forms of skin cancer: basal cell carcinoma; squamous cell carcinoma; and cutaneous malignant melanoma. Exposure to UVR from sunlight and artificial sources early in life elevates the risk of developing skin cancer. Approximately 25% of sun exposure occurs before 18 years of age. The risk of skin cancer is increased when people overexpose themselves to sun and intentionally expose themselves to artificial sources of UVR. Public awareness of the risk is not optimal, compliance with sun protection is inconsistent, and skin-cancer rates continue to rise in all age groups including the younger population. People continue to sunburn, and teenagers and adults are frequent visitors to tanning parlors. Sun exposure and vitamin D status are intertwined. Adequate vitamin D is needed for bone health in children and adults. In addition, there is accumulating information suggesting a beneficial influence of vitamin D on various health conditions. Cutaneous vitamin D production requires sunlight, and many factors complicate the efficiency of vitamin D production that results from sunlight exposure. Ensuring vitamin D adequacy while promoting sun-protection strategies, therefore, requires renewed attention to evaluating the adequacy of dietary and supplemental vitamin D. Daily intake of 400 IU of vitamin D will prevent vitamin D deficiency rickets in infants. The vitamin D supplementation amounts necessary to support optimal health in older children and adolescents are less clear. This report updates information on the relationship of sun exposure to skin cancer and other adverse health effects, the relationship of exposure to artificial sources of UVR and skin cancer, sun-protection methods, vitamin D, community skin-cancer-prevention efforts, and the pediatrician's role in preventing skin cancer. In addition to pediatricians' efforts, a sustained public health effort is needed to change attitudes and behaviors regarding UVR exposure. (3/11)

UNDERINSURANCE OF ADOLESCENTS: RECOMMENDATIONS FOR IMPROVED COVERAGE OF PREVENTIVE, REPRODUCTIVE, AND BEHAVIORAL HEALTH CARE SERVICES

Committee on Adolescence and Committee on Child Health Financing

ABSTRACT. The purpose of this policy statement is to address the serious underinsurance (ie, insurance that exists but is inadequate) problems affecting insured adolescents' access to needed preventive, reproductive, and behavioral health care. In addition, the statement addresses provider payment problems that disproportionately affect clinicians who care for adolescents.

Among adolescents with insurance, particularly private health insurance, coverage of needed services is often inadequate. Benefits are typically limited in scope and amount; certain diagnoses are often excluded; and cost-sharing requirements are often too high. As a result, underinsurance represents a substantial problem among adolescents and adversely affects their health and well-being.

In addition to underinsurance problems, payment problems in the form of inadequate payment, uncompensated care for confidential reproductive services, and the failure of insurers to recognize and pay for certain billing and diagnostic codes are widespread among both private and public insurers. Payment problems negatively affect clinicians' ability to offer needed services to adolescents, especially publicly insured adolescents. (12/08, reaffirmed 8/12)

UNDERSTANDING THE BEHAVIORAL AND EMOTIONAL CONSEQUENCES OF CHILD ABUSE (CLINICAL REPORT)

John Stirling, Jr, MD; Committee on Child Abuse and Neglect; and Section on Adoption and Foster Care (joint with Lisa Amaya-Jackson, MD, MPH, American Academy of Child and Adolescent Psychiatry, and National Center for Child Traumatic Stress)

ABSTRACT. Children who have suffered early abuse or neglect may later present with significant behavior problems including emotional instability, depression, and a tendency to be aggressive or violent with others. Troublesome behaviors may persist long after the abusive or neglectful environment has changed or the child has been in foster care placement. Neurobiological research has shown that early abuse results in an altered physiological response to stressful stimuli, a response that deleteriously affects the child's subsequent socialization. Pediatricians can assist caregivers by helping them recognize the abused or neglected child's altered responses, formulate more effective coping strategies, and mobilize available community resources. (9/08, reaffirmed 8/12)

UPDATE OF NEWBORN SCREENING AND THERAPY FOR CONGENITAL HYPOTHYROIDISM (CLINICAL REPORT)

Susan R. Rose, MD; Section on Endocrinology; and Committee on Genetics (joint with American Thyroid Association; Rosalind S. Brown, MD; and Lawson Wilkins Pediatric Endocrine Society)

ABSTRACT. Unrecognized congenital hypothyroidism leads to mental retardation. Newborn screening and thyroid therapy started within 2 weeks of age can normalize cognitive development. The primary thyroid-stimulating hormone screening has become standard in many parts of the world. However, newborn thyroid screening is not yet universal in some countries. Initial dosage of 10 to 15 µg/kg levothyroxine is recommended. The goals of thyroid hormone therapy should be to maintain frequent evaluations of total thyroxine or free thyroxine in the upper half of the reference range during the first 3 years of life and to normalize the serum thyroid-stimulating hormone concentration to ensure optimal thyroid hormone dosage and compliance.

Improvements in screening and therapy have led to improved developmental outcomes in adults with congenital hypothyroidism who are now in their 20s and 30s. Thyroid hormone regimens used today are more aggressive in targeting early correction of thyroid-stimulating hormone than were those used 20 or even 10 years ago. Thus, newborn infants with congenital hypothyroidism today may have an even better intellectual and neurologic prognosis. Efforts are ongoing to establish the optimal therapy that leads to maximum potential for normal development for infants with congenital hypothyroidism.

Remaining controversy centers on infants whose abnormality in neonatal thyroid function is transient or mild and on optimal care of very low birth weight or preterm infants. Of note, thyroid-stimulating hormone is not elevated in central hypothyroidism. An algorithm is proposed for diagnosis and management.

Physicians must not relinquish their clinical judgment and experience in the face of normal newborn thyroid test results. Hypothyroidism can be acquired after the newborn screening. When clinical symptoms and signs suggest hypothyroidism, regardless of newborn screening results, serum free thyroxine and thyroid-stimulating hormone determinations should be performed. (6/06, reaffirmed 12/11)

UPDATED GUIDANCE FOR PALIVIZUMAB PROPHYLAXIS AMONG INFANTS AND YOUNG CHILDREN AT INCREASED RISK OF HOSPITALIZATION FOR RESPIRATORY SYNCYTIAL VIRUS INFECTION

Committee on Infectious Diseases and Bronchiolitis Guidelines Committee

ABSTRACT. Palivizumab was licensed in June 1998 by the Food and Drug Administration for the reduction of serious lower respiratory tract infection caused by respiratory syncytial virus (RSV) in children at increased risk of severe disease. Since that time, the American Academy of Pediatrics has updated its guidance for the use of palivizumab 4 times as additional data became available to provide a better understanding of infants and young children at greatest risk of hospitalization attributable to RSV infection. The updated recommendations in this policy statement reflect new information regarding the seasonality of RSV circulation, palivizumab pharmacokinetics, the changing incidence of bronchiolitis hospitalizations, the effect of gestational age and other risk factors on RSV hospitalization rates, the mortality of children hospitalized with RSV infection, the effect of prophylaxis on wheezing, and palivizumab-resistant RSV isolates. This policy statement updates and replaces the recommendations found in the 2012 Red Book. (7/14)

See full text on page 1017.

UPDATED GUIDANCE FOR PALIVIZUMAB PROPHYLAXIS AMONG INFANTS AND YOUNG CHILDREN AT INCREASED RISK OF HOSPITALIZATION FOR RESPIRATORY SYNCYTIAL VIRUS INFECTION (TECHNICAL REPORT)

Committee on Infectious Diseases and Bronchiolitis

Guidelines Committee

ABSTRACT. Guidance from the American Academy of Pediatrics (AAP) for the use of palivizumab prophylaxis against respiratory syncytial virus (RSV) was first published in a policy statement in 1998. Guidance initially was based on the result from a single randomized, placebo-controlled clinical trial conducted in 1996–1997 describing an overall reduction in RSV hospitalization rate from 10.6% among placebo recipients to 4.8% among children who received prophylaxis. The results of a second randomized, placebo-controlled trial of children with hemodynamically significant heart disease were published in 2003 and revealed a reduction in RSV hospitalization rate from 9.7% in control subjects to 5.3% among prophylaxis recipients. Because no additional controlled trials regarding efficacy were published, AAP guidance has been updated periodically to reflect the most recent literature regarding children at greatest risk of severe disease. Since the last update in 2012, new data have become available regarding the seasonality of RSV circulation, palivizumab pharmacokinetics, the changing incidence of bronchiolitis hospitalizations, the effects of gestational age and other risk factors on RSV hospitalization rates, the mortality of children hospitalized with RSV infection, and the effect of prophylaxis on wheezing and palivizumab-resistant RSV isolates. These data enable further refinement of AAP guidance to most clearly focus on those children at greatest risk. (7/14)

See full text on page 1027.

UPDATED RECOMMENDATIONS ON THE USE OF MENINGOCOCCAL VACCINES

Committee on Infectious Diseases

ABSTRACT. Since the last policy statement from the American Academy of Pediatrics (AAP) concerning meningococcal vaccine was published in 2011, 2 meningococcal conjugate vaccines have been licensed for use in infants (Hib-MenCY-TT and MenACWY-CRM). The Centers for Disease Control and Prevention (CDC) has published new recommendations, "Prevention and Control of Meningococcal Disease: Recommendations of the Advisory Committee on Immunization Practices," which have been endorsed by the AAP. However, the CDC recommendations were published before licensure of MenACWY-CRM for infant use. This policy statement updates the AAP recommendations for use of meningococcal vaccines in children and adolescents. A more comprehensive review of background and technical information can be found in the CDC publication. (7/14)

See full text on page 1049.

THE USE AND MISUSE OF FRUIT JUICE IN PEDIATRICS

Committee on Nutrition

ABSTRACT. Historically, fruit juice was recommended by pediatricians as a source of vitamin C and an extra source of water for healthy infants and young children as their

diets expanded to include solid foods with higher renal solute. Fruit juice is marketed as a healthy, natural source of vitamins and, in some instances, calcium. Because juice tastes good, children readily accept it. Although juice consumption has some benefits, it also has potential detrimental effects. Pediatricians need to be knowledgeable about juice to inform parents and patients on its appropriate uses. (5/01, reaffirmed 10/06, 8/13)

USE OF CHAPERONES DURING THE PHYSICAL EXAMINATION OF THE PEDIATRIC PATIENT

Committee on Practice and Ambulatory Medicine

ABSTRACT. Physicians should always communicate the scope and nature of the physical examination to be performed to the pediatric patient and his or her parent. This statement addresses the use of chaperones and issues of patient comfort, confidentiality, and privacy. The use of a chaperone should be a shared decision between the patient and physician. In some states, the use of a chaperone is mandated by state regulations. (4/11)

USE OF CODEINE- AND DEXTROMETHORPHAN-CONTAINING COUGH REMEDIES IN CHILDREN

Committee on Drugs

ABSTRACT. Numerous prescription and nonprescription medications are currently available for suppression of cough, a common symptom in children. Because adverse effects and overdosage associated with the administration of cough and cold preparations in children have been reported, education of patients and parents about the lack of proven antitussive effects and the potential risks of these products is needed. (6/97, reaffirmed 5/00, 6/03, 10/06)

THE USE OF COMPLEMENTARY AND ALTERNATIVE MEDICINE IN PEDIATRICS (CLINICAL REPORT)

Kathi J. Kemper, MD, MPH; Sunita Vohra, MD; Richard Walls, MD, PhD; Task Force on Complementary and Alternative Medicine; and Provisional Section on Complementary, Holistic, and Integrative Medicine

ABSTRACT. The American Academy of Pediatrics is dedicated to optimizing the well-being of children and advancing family-centered health care. Related to these goals, the American Academy of Pediatrics recognizes the increasing use of complementary and alternative medicine in children and, as a result, the need to provide information and support for pediatricians. From 2000 to 2002, the American Academy of Pediatrics convened and charged the Task Force on Complementary and Alternative Medicine to address issues related to the use of complementary and alternative medicine in children and to develop resources to educate physicians, patients, and families. One of these resources is this report describing complementary and alternative medicine services, current levels of utilization and financial expenditures, and associated legal and ethical considerations. The subject of complementary and alternative medicine is large and diverse, and consequently, an in-depth discussion of each method of complementary and alternative medicine is beyond the scope of this report. Instead, this report will define terms; describe epidemiology; outline common types of complementary and alternative medicine therapies; review medicolegal, ethical, and research implica-

tions; review education and training for complementary and alternative medicine providers; provide resources for learning more about complementary and alternative medicine; and suggest communication strategies to use when discussing complementary and alternative medicine with patients and families. (12/08, reaffirmed 10/12, 1/13)

USE OF INHALED NITRIC OXIDE

Committee on Fetus and Newborn

ABSTRACT. Approval of inhaled nitric oxide by the US Food and Drug Administration for hypoxic respiratory failure of the term and near-term newborn provides an important new therapy for this serious condition. This statement addresses the conditions under which inhaled nitric oxide should be administered to the neonate with hypoxic respiratory failure. (8/00, reaffirmed 4/03, 12/09)

USE OF INHALED NITRIC OXIDE IN PRETERM INFANTS (CLINICAL REPORT)

Praveen Kumar, MD, FAAP, and Committee on Fetus and Newborn

ABSTRACT. Nitric oxide, an important signaling molecule with multiple regulatory effects throughout the body, is an important tool for the treatment of full-term and late-preterm infants with persistent pulmonary hypertension of the newborn and hypoxemic respiratory failure. Several randomized controlled trials have evaluated its role in the management of preterm infants ≤ 34 weeks' gestational age with varying results. The purpose of this clinical report is to summarize the existing evidence for the use of inhaled nitric oxide in preterm infants and provide guidance regarding its use in this population. (12/13)

USE OF PERFORMANCE-ENHANCING SUBSTANCES

Committee on Sports Medicine and Fitness

ABSTRACT. Performance-enhancing substances include dietary supplements, prescription medications, and illicit drugs. Virtually no data are available on the efficacy and safety in children and adolescents of widely used performance-enhancing substances. This statement is intended to provide a generalized but functional definition of performance-enhancing substances. The American Academy of Pediatrics strongly condemns the use of performance-enhancing substances and vigorously endorses efforts to eliminate their use among children and adolescents. (4/05, reaffirmed 5/08)

USE OF SOY PROTEIN-BASED FORMULAS IN INFANT FEEDING (CLINICAL REPORT)

Jatinder Bhatia, MD; Frank Greer, MD; and Committee on Nutrition

ABSTRACT. Soy protein-based formulas have been available for almost 100 years. Since the first use of soy formula as a milk substitute for an infant unable to tolerate a cow milk protein-based formula, the formulation has changed to the current soy protein isolate. Despite very limited indications for its use, soy protein-based formulas in the United States may account for nearly 25% of the formula market. This report reviews the limited indications and contraindications of soy formulas. It will also review the potential harmful effects of soy protein-based formulas and the phytoestrogens contained in these formulas. (5/08)

THE USE OF SYSTEMIC AND TOPICAL FLUOROQUINOLONES (CLINICAL REPORT)

John S. Bradley, MD; Mary Anne Jackson, MD; and Committee on Infectious Diseases

ABSTRACT. Appropriate prescribing practices for fluoroquinolones are essential as evolving resistance patterns are considered, additional treatment indications are identified, and the toxicity profile of fluoroquinolones in children becomes better defined. Earlier recommendations for systemic therapy remain; expanded uses of fluoroquinolones for the treatment of certain infections are outlined in this report. Although fluoroquinolones are reasonably safe in children, clinicians should be aware of the specific adverse reactions. Use of fluoroquinolones in children should continue to be limited to treatment of infections for which no safe and effective alternative exists. (9/11)

USES OF DRUGS NOT DESCRIBED IN THE PACKAGE INSERT (OFF-LABEL USES)

Committee on Drugs

ABSTRACT. New regulatory initiatives have been designed to ensure that new drugs and biologicals include adequate pediatric labeling for the claimed indications at the time of, or soon after, approval. However, because such labeling may not immediately be available, off-label use (or use that is not included in the approved label) of therapeutic agents is likely to remain common in the practice of pediatrics. This policy statement was written to address questions practitioners have regarding off-label use. The purpose of off-label use is to benefit the individual patient. Practitioners may use their professional judgment to determine these uses. Practitioners should understand that the Food and Drug Administration does not regulate off-label use. (7/02, reaffirmed 10/05)

VENTRICULAR FIBRILLATION AND THE USE OF AUTOMATED EXTERNAL DEFIBRILLATORS ON CHILDREN

Committee on Pediatric Emergency Medicine and Section on Cardiology and Cardiac Surgery

ABSTRACT. The use of automated external defibrillators (AEDs) has been advocated in recent years as one part of the chain of survival to improve outcomes for adult cardiac arrest victims. When AEDs first entered the market, they had not been tested for pediatric usage and rhythm interpretation. In addition, the presumption was that children do not experience ventricular fibrillation, so they would not benefit from the use of AEDs. Recent literature has shown that children do experience ventricular fibrillation, which has a better outcome than do other cardiac arrest rhythms. At the same time, the arrhythmia software on AEDs has become more extensive and validated for children, and attenuation devices have become available to downregulate the energy delivered by AEDs to allow their use on children. Pediatricians are now being asked whether AED programs should be implemented, and where they are being implemented, pediatricians are being asked to provide guidance on the use of them on children. As AED programs expand, pediatricians must advocate on behalf of children so that their needs are accounted for. For pediatricians to be able to provide guidance and ensure that children are included in AED programs, it is important for pediatricians to know how

AEDs work, be up-to-date on the literature regarding pediatric fibrillation and energy delivery, and understand the role of AEDs as life-saving interventions for children. (11/07, reaffirmed 6/11, 7/14)

WHEN IS LACK OF SUPERVISION NEGLECT? (CLINICAL REPORT)

Kent P. Hymel, MD, and Committee on Child Abuse and Neglect
ABSTRACT. Occasionally, pediatricians become aware of children who are inadequately supervised. More frequently, pediatricians treat children for traumatic injuries or ingestions that they suspect could have been prevented with better supervision. This clinical report contains guidance for pediatricians considering a referral to a child protective services agency on the basis of suspicion of supervisory neglect. (9/06)

WIC PROGRAM

Provisional Section on Breastfeeding

ABSTRACT. This policy statement highlights the important collaboration between pediatricians and local Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) programs to ensure that infants and children receive high-quality, cost-effective health care and nutrition services. Specific recommendations are provided for pediatricians and WIC personnel to help children and their families receive optimum services through a medical home. (11/01)

WITHHOLDING OR TERMINATION OF RESUSCITATION IN PEDIATRIC OUT-OF-HOSPITAL TRAUMATIC CARDIOPULMONARY ARREST

*Committee on Pediatric Emergency Medicine (joint with
American College of Surgeons Committee on Trauma and
National Association of EMS Physicians)*

ABSTRACT. This multiorganizational literature review was undertaken to provide an evidence base for determining whether recommendations for out-of-hospital termination of resuscitation could be made for children who are victims of traumatic cardiopulmonary arrest. Although there is increasing acceptance of out-of-hospital termination of resuscitation for adult traumatic cardiopulmonary arrest when there is no expectation of a good outcome, children are routinely excluded from state termination-of-resuscitation protocols. The decision to withhold resuscitative efforts in a child under specific circumstances (decapitation or dependent lividity, rigor

mortis, etc) is reasonable. If there is any doubt as to the circumstances or timing of the traumatic cardiopulmonary arrest, under the current status of limiting termination of resuscitation in the field to persons older than 18 years in most states, resuscitation should be initiated and continued until arrival to the appropriate facility. If the patient has arrested, resuscitation has already exceeded 30 minutes, and the nearest facility is more than 30 minutes away, involvement of parents and family of these children in the decision-making process with assistance and guidance from medical professionals should be considered as part of an emphasis on family-centered care because the evidence suggests that either death or a poor outcome is inevitable. (3/14)

YEAR 2007 POSITION STATEMENT: PRINCIPLES AND GUIDELINES FOR EARLY HEARING DETECTION AND INTERVENTION PROGRAMS:

Joint Committee on Infant Hearing

ABSTRACT. The Joint Committee on Infant Hearing (JCIH) endorses early detection of and intervention for infants with hearing loss. The goal of early hearing detection and intervention (EHDI) is to maximize linguistic competence and literacy development for children who are deaf or hard of hearing. Without appropriate opportunities to learn language, these children will fall behind their hearing peers in communication, cognition, reading, and social-emotional development. Such delays may result in lower educational and employment levels in adulthood. To maximize the outcome for infants who are deaf or hard of hearing, the hearing of all infants should be screened at no later than 1 month of age. Those who do not pass screening should have a comprehensive audiological evaluation at no later than 3 months of age. Infants with confirmed hearing loss should receive appropriate intervention at no later than 6 months of age from health care and education professionals with expertise in hearing loss and deafness in infants and young children. Regardless of previous hearing-screening outcomes, all infants with or without risk factors should receive ongoing surveillance of communicative development beginning at 2 months of age during well-child visits in the medical home. EHDI systems should guarantee seamless transitions for infants and their families through this process. (10/07)

ADVANCED PRACTICE REGISTERED NURSE: ROLE, PREPARATION, AND SCOPE OF PRACTICE

National Association of Neonatal Nurses

In recent years, the National Association of Neonatal Nurses (NANN) and the National Association of Neonatal Nurse Practitioners (NANNP) have developed several policy statements on neonatal advanced practice registered nurse (APRN) workforce, education, competency, fatigue, safety, and scope of practice. This position paper is a synthesis of previous efforts and discusses the role, preparation, and scope of practice of the neonatal APRN. (1/14)

APPROPRIATE USE CRITERIA FOR INITIAL TRANSTHORACIC ECHOCARDIOGRAPHY IN OUTPATIENT PEDIATRIC CARDIOLOGY

American College of Cardiology Appropriate Use Task Force

ABSTRACT. The American College of Cardiology (ACC) participated in a joint project with the American Society of Echocardiography, the Society of Pediatric Echocardiography, and several other subspecialty societies and organizations to establish and evaluate Appropriate Use Criteria (AUC) for the initial use of outpatient pediatric echocardiography. Assumptions for the AUC were identified, including the fact that all indications assumed a first-time transthoracic echocardiographic study in an outpatient setting for patients without previously known heart disease. The definitions for frequently used terminology in outpatient pediatric cardiology were established using published guidelines and standards and expert opinion. These AUC serve as a guide to help clinicians in the care of children with possible heart disease, specifically in terms of when a transthoracic echocardiogram is warranted as an initial diagnostic modality in the outpatient setting. They are also a useful tool for education and provide the infrastructure for future quality improvement initiatives as well as research in healthcare delivery, outcomes, and resource utilization.

To complete the AUC process, the writing group identified 113 indications based on common clinical scenarios and/or published clinical practice guidelines, and each indication was classified into 1 of 9 categories of common clinical presentations, including palpitations, syncope, chest pain, and murmur. A separate, independent rating panel evaluated each indication using a scoring scale of 1 to 9, thereby designating each indication as "Appropriate" (median score 7 to 9), "May Be Appropriate" (median score 4 to 6), or "Rarely Appropriate" (median score 1 to 3). Fifty-three indications were identified as Appropriate, 28 as May Be Appropriate, and 32 as Rarely Appropriate. (11/14)

BEST PRACTICE FOR INFANT SURGERY: A POSITION STATEMENT FROM THE AMERICAN PEDIATRIC SURGICAL ASSOCIATION

American Pediatric Surgical Association (9/08)

CARDIOVASCULAR RISK REDUCTION IN HIGH-RISK PEDIATRIC POPULATIONS

American Heart Association

ABSTRACT. Although for most children the process of atherosclerosis is subclinical, dramatically accelerated atherosclerosis occurs in some pediatric disease states, with clinical coronary events occurring in childhood and very early adult life. As with most scientific statements about children and the future risk for cardiovascular disease, there are no randomized trials documenting the effects of risk reduction on hard clinical outcomes. A growing body of literature, however, identifies the importance of premature cardiovascular disease in the course of certain pediatric diagnoses and addresses the response to risk factor reduction. For this scientific statement, a panel of experts reviewed what is known about very premature cardiovascular disease in 8 high-risk pediatric diagnoses and, from the science base, developed practical recommendations for management of cardiovascular risk. (*Circulation*. 2006;114:000-000.) (12/06)

A COMPREHENSIVE IMMUNIZATION STRATEGY TO ELIMINATE TRANSMISSION OF HEPATITIS B VIRUS INFECTION IN THE UNITED STATES

Advisory Committee on Immunization Practices and Centers for Disease Control and Prevention

SUMMARY. This report is the first of a two-part statement from the Advisory Committee on Immunization Practices (ACIP) that updates the strategy to eliminate hepatitis B virus (HBV) transmission in the United States. The report provides updated recommendations to improve prevention of perinatal and early childhood HBV transmission, including implementation of universal infant vaccination beginning at birth, and to increase vaccine coverage among previously unvaccinated children and adolescents. Strategies to enhance implementation of the recommendations include 1) establishing standing orders for administration of hepatitis B vaccination beginning at birth; 2) instituting delivery hospital policies and procedures and case management programs to improve identification of and administration of immunoprophylaxis to infants born to mothers who are hepatitis B surface antigen (HBsAg) positive and to mothers with unknown HBsAg status at the time of delivery; and 3) implementing vaccination record reviews for all children aged 11-12 years and children and adolescents aged <19 years who were born in countries with intermediate and high levels of HBV endemicity, adopting hepatitis B vaccine requirements for school entry, and integrating hepatitis B vaccination services into settings that serve adolescents. The second part of the ACIP statement, which will include

updated recommendations and strategies to increase hepatitis B vaccination of adults, will be published separately. (7/06)

CONSENSUS STATEMENT ON MANAGEMENT OF INTERSEX DISORDERS

International Consensus Conference on Intersex (Lawson Wilkins Pediatric Endocrine Society and European Society for Paediatric Endocrinology)

INTRODUCTION. The birth of an intersex child prompts a long-term management strategy that involves myriad professionals working with the family. There has been progress in diagnosis, surgical techniques, understanding psychosocial issues, and recognizing and accepting the place of patient advocacy. The Lawson Wilkins Pediatric Endocrine Society and the European Society for Paediatric Endocrinology considered it timely to review the management of intersex disorders from a broad perspective, review data on longer-term outcome, and formulate proposals for future studies. The methodology comprised establishing a number of working groups, the membership of which was drawn from 50 international experts in the field. The groups prepared previous written responses to a defined set of questions resulting from evidence-based review of the literature. At a subsequent gathering of participants, a framework for a consensus document was agreed. This article constitutes its final form. (8/06)

DEFINING PEDIATRIC MALNUTRITION: A PARADIGM SHIFT TOWARD ETIOLOGY-RELATED DEFINITIONS

American Society for Parenteral and Enteral Nutrition

ABSTRACT. Lack of a uniform definition is responsible for underrecognition of the prevalence of malnutrition and its impact on outcomes in children. A pediatric malnutrition definitions workgroup reviewed existing pediatric age group English-language literature from 1955 to 2011, for relevant references related to 5 domains of the definition of *malnutrition* that were *a priori* identified: anthropometric parameters, growth, chronicity of malnutrition, etiology and pathogenesis, and developmental/ functional outcomes. Based on available evidence and an iterative process to arrive at multidisciplinary consensus in the group, these domains were included in the overall construct of a new definition. Pediatric malnutrition (undernutrition) is defined as an imbalance between nutrient requirements and intake that results in cumulative deficits of energy, protein, or micronutrients that may negatively affect growth, development, and other relevant outcomes. A summary of the literature is presented and a new classification scheme is proposed that incorporates chronicity, etiology, mechanisms of nutrient imbalance, severity of malnutrition, and its impact on outcomes. Based on its etiology, malnutrition is either *illness related* (secondary to

1 or more diseases/injury) or *non-illness related*, (caused by environmental/behavioral factors), or both. Future research must focus on the relationship between inflammation and illness-related malnutrition. We anticipate that the definition of malnutrition will continue to evolve with improved understanding of the processes that lead to and complicate the treatment of this condition. A uniform definition should permit future research to focus on the impact of pediatric malnutrition on functional outcomes and help solidify the scientific basis for evidence-based nutrition practices. EVIDENCE REPORT: GENETIC AND METABOLIC TESTING ON CHILDREN WITH GLOBAL DEVELOPMENTAL DELAY

American Academy of Neurology and Child Neurology Society
ABSTRACT. *Objective.* To systematically review the evidence concerning the diagnostic yield of genetic and metabolic evaluation of children with global developmental delay or intellectual disability (GDD/ID).

Methods. Relevant literature was reviewed, abstracted, and classified according to the 4-tiered American Academy of Neurology classification of evidence scheme.

Results and Conclusions. In patients with GDD/ID, microarray testing is diagnostic on average in 7.8% (Class III), G-banded karyotyping is abnormal in at least 4% (Class II and III), and subtelomeric fluorescence in situ hybridization is positive in 3.5% (Class I, II, and III). Testing for X-linked ID genes has a yield of up to 42% in males with an appropriate family history (Class III). *FMR1* testing shows full expansion in at least 2% of patients with mild to moderate GDD/ID (Class II and III), and *MeCP2* testing is diagnostic in 1.5% of females with moderate to severe GDD/ID (Class III). Tests for metabolic disorders have a yield of up to 5%, and tests for congenital disorders of glycosylation and cerebral creatine disorders have yields of up to 2.8% (Class III). Several genetic and metabolic screening tests have been shown to have a better than 1%

diagnostic yield in selected populations of children with GDD/ID. These values should be among the many factors considered in planning the laboratory evaluation of such children. (9/11)

EVIDENCE-BASED GUIDELINE UPDATE: MEDICAL TREATMENT OF INFANTILE SPASMS

American Academy of Neurology and Child Neurology Society
ABSTRACT. Objective. To update the 2004 American Academy of Neurology/Child Neurology Society practice parameter on treatment of infantile spasms in children.

Methods. MEDLINE and EMBASE were searched from 2002 to 2011 and searches of reference lists of retrieved articles were performed. Sixty-eight articles were selected for detailed review; 26 were included in the analysis. Recommendations were based on a 4-tiered classification scheme combining pre-2002 evidence and more recent evidence.

Results. There is insufficient evidence to determine whether other forms of corticosteroids are as effective as adrenocorticotrophic hormone (ACTH) for short-term treatment of infantile spasms. However, low-dose ACTH is probably as effective as high-dose ACTH. ACTH is more effective than vigabatrin (VGB) for short-term treatment of children with infantile spasms (excluding those with tuberous sclerosis complex). There is insufficient evidence to show that other agents and combination therapy are effective for short-term treatment of infantile spasms. Short lag time to treatment leads to better long-term developmental outcome. Successful short-term treatment of cryptogenic infantile spasms with ACTH or prednisolone leads to better long-term developmental outcome than treatment with VGB.

Recommendations. Low-dose ACTH should be considered for treatment of infantile spasms. ACTH or VGB may be useful for short-term treatment of infantile spasms, with ACTH considered preferentially over VGB. Hormonal therapy (ACTH or prednisolone) may be considered for use in preference to VGB in infants with cryptogenic infantile spasms, to possibly improve developmental outcome. A shorter lag time to treatment of infantile spasms with either hormonal therapy or VGB possibly improves long-term developmental outcomes. (6/12)

EXPEDITED PARTNER THERAPY FOR ADOLESCENTS DIAGNOSED WITH CHLAMYDIA OR GONORRHEA: A POSITION PAPER OF THE SOCIETY FOR ADOLESCENT MEDICINE

Society for Adolescent Medicine

ABSTRACT. Chlamydia and gonorrhea, the most frequently reported sexually transmitted infections (STIs), present substantial public health challenges among adolescents. Although these infections are easily treated with antibiotics, many adolescents are reinfected within 3–6 months, usually because their partners remain untreated.

The standard approaches to notifying and treating a partner of an STI-infected patient are patient referral, whereby the patient notifies his/her partners to seek care, and provider referral, whereby the provider or public health disease intervention specialist notifies the partner and directs him/her toward treatment. These methods rely on the accuracy of the disclosed partner information as well as other limitations, such as compliance and staffing resources. Another approach to partner notification is expedited partner therapy (EPT), treating sex partners without requiring a prior clinical evaluation. In randomized trials, EPT has reduced the rates of persistent or recurrent gonorrhea and chlamydia infection; however, its routine use is limited by concerns related to liability, cost, compliance, and missed opportunities for prevention counseling. The Society for Adolescent Medicine (SAM) recommends that providers who care for adolescents should do the following: use EPT as an option for STI care among chlamydia- or gonorrhea-infected heterosexual males and females who are unlikely or unable to otherwise receive treatment; through SAM and AAP chapters, collaborate with policy makers to remove EPT legal barriers and facilitate reimbursement; and collaborate with health departments for implementation assistance. (9/09)

EXPERT PANEL ON INTEGRATED GUIDELINES FOR CARDIOVASCULAR HEALTH AND RISK REDUCTION IN CHILDREN AND ADOLESCENTS: SUMMARY REPORT

National Heart, Lung and Blood Institute

INTRODUCTION (EXCERPT). Atherosclerotic cardiovascular disease (CVD) remains the leading cause of death in North Americans, but manifest disease in childhood and adolescence is rare. By contrast, risk factors and risk behaviors that accelerate the development of atherosclerosis begin in childhood, and there is increasing evidence that risk reduction delays progression toward clinical disease. In response, the former director of the National Heart, Lung, and Blood Institute (NHLBI), Dr Elizabeth Nabel, initiated development of cardiovascular health guidelines for pediatric care providers based on a formal evidence review of the science with an integrated format addressing all the major cardiovascular risk factors simultaneously. An expert panel was appointed to develop the guidelines in the fall of 2006. (3/12)

GENERAL RECOMMENDATIONS ON IMMUNIZATION: RECOMMENDATIONS OF THE ADVISORY COMMITTEE ON IMMUNIZATION PRACTICES (ACIP)

Advisory Committee on Immunization Practices

SUMMARY. This report is a revision of General Recommendations on Immunization and updates the 2002 statement by the Advisory Committee on Immunization Practices (ACIP) (CDC. General recommendations on immunization: recommendations of the Advisory Committee on Immunization Practices and the American Academy of Family Physicians. *MMWR* 2002;51[No. RR-2]). This report is intended to serve as a general reference on vaccines and immunization. The principal changes include 1) expansion of the discussion of vac-

cination spacing and timing; 2) an increased emphasis on the importance of injection technique/age/body mass in determining appropriate needle length; 3) expansion of the discussion of storage and handling of vaccines, with a table defining the appropriate storage temperature range for inactivated and live vaccines; 4) expansion of the discussion of altered immunocompetence, including new recommendations about use of live-attenuated vaccines with therapeutic monoclonal antibodies; and 5) minor changes to the recommendations about vaccination during pregnancy and vaccination of internationally adopted children, in accordance with new ACIP vaccine-specific recommendations for use of inactivated influenza vaccine and hepatitis B vaccine. The most recent ACIP recommendations for each specific vaccine should be consulted for comprehensive discussion. This report, ACIP recommendations for each vaccine, and other information about vaccination can be accessed at CDC's National Center for Immunization and Respiratory Diseases (proposed) (formerly known as the National Immunization Program) website at <http://www.cdc.gov/nip>. (12/06)

GENETIC BASIS FOR CONGENITAL HEART DEFECTS: CURRENT KNOWLEDGE

American Heart Association

ABSTRACT. The intent of this review is to provide the clinician with a summary of what is currently known about the contribution of genetics to the origin of congenital heart disease. Techniques are discussed to evaluate children with heart disease for genetic alterations. Many of these techniques are now available on a clinical basis. Information on the genetic and clinical evaluation of children with cardiac disease is presented, and several tables have been constructed to aid the clinician in the assessment of children with different types of heart disease. Genetic algorithms for cardiac defects have been constructed and are available in an appendix. It is anticipated that this summary will update a wide range of medical personnel, including pediatric cardiologists and pediatricians, adult cardiologists, internists, obstetricians, nurses, and thoracic surgeons, about the genetic aspects of congenital heart disease and will encourage an interdisciplinary approach to the child and adult with congenital heart disease. IMPORTANCE AND IMPLEMENTATION OF TRAINING IN CARDIOPULMONARY RESUSCITATION AND AUTOMATED EXTERNAL DEFIBRILLATION IN SCHOOLS

American Heart Association Emergency Cardiovascular Care Committee; Council on Cardiopulmonary, Critical Care, Perioperative and Resuscitation; Council on Cardiovascular Diseases in the Young; Council on Cardiovascular Nursing; Council on Clinical Cardiology; and Advocacy Coordinating Committee

ABSTRACT. In 2003, the International Liaison Committee on Resuscitation published a consensus document on education in resuscitation that strongly recommended that "...instruction in CPR [cardiopulmonary resuscitation] be incorporated as a standard part of the school curriculum." The next year the American Heart Association (AHA) recommended that schools "...establish a goal to train every teacher in CPR and first aid and train all students in CPR" as part of their preparation for a response to medical emergencies on campus.

Since that time, there has been an increased interest in legislation that would mandate that school curricula include training in CPR or CPR and automated external defibrillation. Laws or curriculum content standards in 36 states (as of the 2009–2010 school year) now encourage the inclusion of CPR training programs in school curricula. The language in those laws and standards varies greatly, ranging from a suggestion that students "recognize" the steps of CPR to a requirement for certification in CPR. Not surprisingly, then, implementation is not uniform among states, even those whose laws or standards encourage CPR training in schools in the strongest language. This statement recommends that training in CPR and familiarization with automated external defibrillators (AEDs) should be required elements of secondary school curricula and provides the rationale for implementation of CPR training, as well as guidance in overcoming barriers to implementation. INTER-ASSOCIATION CONSENSUS STATEMENT ON BEST PRACTICES FOR SPORTS MEDICINE MANAGEMENT FOR SECONDARY SCHOOLS AND COLLEGES

National Athletic Trainers Association, National Interscholastic Athletic Administrators Association, College Athletic Trainers' Society, National Federation of State High School Associations, American College Health Association, American Orthopaedic Society for Sports Medicine, National Collegiate Athletic Association, American Medical Society for Sports Medicine, National Association of Collegiate Directors of Athletics, and National Association of Intercollegiate Athletics (7/13)

LIGHTNING SAFETY FOR ATHLETICS AND RECREATION

National Athletic Trainers' Association

ABSTRACT. *Objective.* To educate athletic trainers and others about the dangers of lightning, provide lightning-safety guidelines, define safe structures and locations, and advocate prehospital care for lightning-strike victims. *Background.* Lightning may be the most frequently encountered severe-storm hazard endangering physically active people each year. Millions of lightning flashes strike the

ground annually in the United States, causing nearly 100 deaths and 400 injuries. Three quarters of all lightning casualties occur between May and September, and nearly four fifths occur between 10:00 AM and 7:00 PM, which coincides with the hours for most athletic or recreational activities. Additionally, lightning casualties from sports and recreational activities have risen alarmingly in recent decades.

Recommendations. The National Athletic Trainers' Association recommends a proactive approach to lightning safety, including the implementation of a lightning-safety policy that identifies safe locations for shelter from the lightning hazard. Further components of this policy are monitoring local weather forecasts, designating a weather watcher, and establishing a chain of command. Additionally, a flash-to-bang count of 30 seconds or more should be used as a minimal determinant of when to suspend activities. Waiting 30 minutes or longer after the last flash of lightning or sound of thunder is recommended before athletic or recreational activities are resumed. Lightning safety strategies include avoiding shelter under trees, avoiding open fields and spaces, and suspending the use of land-line telephones during thunderstorms. Also outlined in this document are the prehospital care guidelines for triaging and treating lightning-strike victims. It is important to evaluate victims quickly for apnea, asystole, hypothermia, shock, fractures, and burns. Cardiopulmonary resuscitation is effective in resuscitating pulseless victims of lightning strike. Maintenance of cardiopulmonary resuscitation and first-aid certification should be required of all persons involved in sports and recreational activities. (12/00)

American Academy of Child and Adolescent Psychiatry and Child Welfare League of America (2003)

MULTILINGUAL CHILDREN: BEYOND MYTHS AND TOWARD BEST PRACTICES

Society for Research in Child Development

ABSTRACT. Multilingualism is an international fact of life and increasing in the United States. Multilingual families are exceedingly diverse, and policies relevant to them should take this into account. The quantity and quality of a child's exposure to responsive conversation spoken by fluent adults predicts both monolingual and multilingual language and literacy achievement. Contexts supporting optimal multilingualism involve early exposure to high quality conversation in each language, along with continued support for speaking both languages. Parents who are not fluent in English should not be told to speak English instead of their native language to their children; children require fluent input, and fluent input in another language will transfer to learning a second or third language. Messages regarding optimal multilingual practices should be made available to families using any and all available methods for delivering such information, including home visitation programs, healthcare settings, center-based early childhood programs, and mass media. (2013)

NATIONAL ADOPTION CENTER: OPEN RECORDS

National Adoption Center

The National Adoption Center believes that it is an inalienable right of all citizens, including adopted adults, to have unencumbered access to their original birth certificates. In keeping with this position, we believe that copies of both the original and the amended birth certificate should be given to the adoptive family at the time of finalization unless specifically denied by the birthparents. In any case, the National Adoption Center advocates that the adoptee, at age 18, be granted access to his/her original birth certificate. (6/00)

NEONATAL ENCEPHALOPATHY AND NEUROLOGIC OUTCOME, SECOND EDITION

American College of Obstetricians and Gynecologists Task Force on Neonatal Encephalopathy

In the first edition of this report, the Task Force on Neonatal Encephalopathy and Cerebral Palsy outlined criteria deemed essential to establish a causal link between intrapartum hypoxic events and cerebral palsy. It is now known that there are multiple potential causal pathways that lead to cerebral palsy in term infants (see Fig 1), and the signs and symptoms of neonatal encephalopathy may range from mild to severe, depending on the nature and timing of the brain injury. Thus, for the current edition, the Task Force on Neonatal Encephalopathy determined that a broader perspective may be more fruitful. This conclusion reflects the sober recognition that knowledge gaps still preclude a definitive test or set of markers that accurately identifies, with high sensitivity and specificity, an infant in whom neonatal encephalopathy is attributable to an acute intrapartum event. The information necessary for assessment of likelihood can be derived from a comprehensive evaluation of all potential contributing factors in cases of neonatal encephalopathy. This is the broader perspective championed in the current report. If a comprehensive etiologic evaluation is not possible, the term hypoxic-ischemic encephalopathy should best be replaced

by neonatal encephalopathy because neither hypoxia nor ischemia can be assumed to have been the unique initiating causal mechanism. The title of this report has been changed from Neonatal Encephalopathy and Cerebral Palsy: Defining the Pathogenesis and Pathophysiology to Neonatal Encephalopathy and Neurologic Outcome to indicate that an array of developmental outcomes may arise after neonatal encephalopathy in addition to cerebral palsy. (4/14)

NEURODEVELOPMENTAL OUTCOMES IN CHILDREN WITH CONGENITAL HEART DISEASE: EVALUATION AND MANAGEMENT: A SCIENTIFIC STATEMENT FROM THE AMERICAN HEART ASSOCIATION

American Heart Association (7/12)

NONINHERITED RISK FACTORS AND CONGENITAL CARDIOVASCULAR DEFECTS: CURRENT KNOWLEDGE

American Heart Association

ABSTRACT. Prevention of congenital cardiovascular defects has been hampered by a lack of information about modifiable risk factors for abnormalities in cardiac development. Over the past decade, there have been major breakthroughs in the understanding of inherited causes of congenital heart disease, including the identification of specific genetic abnormalities for some types of malformations. Although relatively less information has been available on noninherited modifiable factors that may have an adverse effect on the fetal heart, there is a growing body of epidemiological literature on this topic. This statement summarizes the currently available literature on potential fetal exposures that might alter risk for cardiovascular defects. Information is summarized for periconceptional multivitamin or folic acid intake, which may reduce the risk of cardiac disease in the fetus, and for additional types of potential exposures that may increase the risk, including maternal illnesses, maternal therapeutic and nontherapeutic drug exposures, environmental exposures, and paternal exposures. Information is highlighted regarding definitive risk factors such as maternal rubella; phenylketonuria; pregestational diabetes; exposure to thalidomide, vitamin A congeners, or retinoids; and indomethacin tocolysis. Caveats regarding interpretation of possible exposure-outcome relationships from case-control studies are given because this type of study has provided most of the available information. Guidelines for prospective parents that could reduce the likelihood that their child will have a major cardiac malformation are given. Issues related to pregnancy monitoring are discussed. Knowledge gaps and future sources of new information on risk factors are described. (*Circulation*. 2007;115:2995–3014.) (6/07)

PEDIATRIC CARE IN THE EMERGENCY DEPARTMENT

Society for Academic Emergency Medicine

ABSTRACT. Physicians who have successfully completed an accredited Emergency Medicine residency and are certified in emergency medicine by the American Board of Emergency Medicine (ABEM) or the American Osteopathic Board of Emergency Medicine (AOBEM) ABEM/AOBEM or those who are certified in pediatric emergency medicine by ABEM or the American Board of Pediatrics (ABP) possess the knowledge and skills

required to provide quality emergency medical care to children of all ages for a wide variety of illnesses, injuries or poisonings. To provide quality care, the emergency physician must have all necessary and age-appropriate medical equipment readily available. The emergency physician must also have access via consultation, admission, or transfer, to appropriate specialty and sub-specialty physicians, to who will provide any needed patient care after emergency department treatment. Physically separated care areas for children are not mandatory in order to provide high-quality care to patients of all ages. Although physically separate care areas for children are ideal, they are not mandatory to provide high-quality care. (11/03)

PREVENTION AND CONTROL OF MENINGOCOCCAL DISEASE: RECOMMENDATIONS OF THE ADVISORY COMMITTEE ON IMMUNIZATION PRACTICES (ACIP)

Centers for Disease Control and Prevention

SUMMARY. Meningococcal disease describes the spectrum of infections caused by *Neisseria meningitidis*, including meningitis, bacteremia, and bacteremic pneumonia. Two quadrivalent meningococcal polysaccharide-protein conjugate vaccines that provide protection against meningococcal serogroups A, C, W, and Y (MenACWY-D [Menactra, manufactured by Sanofi Pasteur, Inc., Swiftwater, Pennsylvania] and MenACWY-CRM [Menveo, manufactured by Novartis Vaccines, Cambridge, Massachusetts]) are licensed in the United States for use among persons aged 2 through 55 years. MenACWY-D also is licensed for use among infants and toddlers aged 9 through 23 months. Quadrivalent meningococcal polysaccharide vaccine (MPSV4 [Menomune, manufactured by sanofi pasteur, Inc., Swiftwater, Pennsylvania]) is the only vaccine licensed for use among persons aged ≥56 years. A bivalent meningococcal polysaccharide protein conjugate vaccine that provides protection against meningococcal serogroups C and Y along with *Haemophilus influenzae* type b (Hib) (Hib-MenCY-TT [MenHibrix, manufactured by GlaxoSmithKline Biologicals, Rixensart, Belgium]) is licensed for use in children aged 6 weeks through 18 months.

This report compiles and summarizes all recommendations from CDC's Advisory Committee on Immunization Practices (ACIP) regarding prevention and control of meningococcal disease in the United States, specifically the changes in the recommendations published since 2005 (CDC. Prevention and control of meningococcal disease: recommendations of the Advisory Committee on Immunization Practices [ACIP]. MMWR 2005;54 Adobe PDF file [No. RR-7]). As a comprehensive summary of previously published recommendations, this report does not contain any new recommendations; it is intended for use by clinicians as a resource. ACIP recommends routine vaccination with a quadrivalent meningococcal conjugate vaccine (MenACWY) for adolescents aged 11 or 12 years, with a booster dose at age 16 years. ACIP also recommends routine vaccination for persons at increased risk for meningococcal disease (i.e., persons who have persistent complement component deficiencies, persons who have anatomic or functional asplenia, microbiologists who routinely are exposed to isolates of *N. meningitidis*,

military recruits, and persons who travel to or reside in areas in which meningococcal disease is hyperendemic or epidemic). Guidelines for antimicrobial chemoprophylaxis and for evaluation and management of suspected outbreaks of meningococcal disease also are provided. (3/13)

PREVENTION OF RHEUMATIC FEVER AND DIAGNOSIS AND TREATMENT OF ACUTE STREPTOCOCCAL PHARYNGITIS

American Heart Association Rheumatic Fever, Endocarditis, and Kawasaki Disease Committee of the Council on Cardiovascular Disease in the Young; Interdisciplinary Council on Functional Genomics and Translational Biology; and Interdisciplinary Council on Quality of Care and Outcomes Research

ABSTRACT. Primary prevention of acute rheumatic fever is accomplished by proper identification and adequate antibiotic treatment of group A α -hemolytic streptococcal (GAS) tonsillopharyngitis. Diagnosis of GAS pharyngitis is best accomplished by combining clinical judgment with diagnostic test results, the criterion standard of which is the throat culture. Penicillin (either oral penicillin V or injectable benzathine penicillin) is the treatment of choice, because it is cost-effective, has a narrow spectrum of activity, and has long-standing proven efficacy, and GAS resistant to penicillin have not been documented. For penicillin-allergic individuals, acceptable alternatives include a narrow-spectrum oral cephalosporin, oral clindamycin, or various oral macrolides or azalides. The individual who has had an attack of rheumatic fever is at very high risk of developing recurrences after subsequent GAS pharyngitis and needs continuous antimicrobial prophylaxis to prevent such recurrences (secondary prevention). The recommended duration of prophylaxis depends on the number of previous attacks, the time elapsed since the last attack, the risk of exposure to GAS infections, the age of the patient, and the presence or absence of cardiac involvement. Penicillin is again the agent of choice for secondary prophylaxis, but sulfadiazine or a macrolide or azalide are acceptable alternatives in penicillin-allergic individuals. This report updates the 1995 statement by the American Heart Association Rheumatic Fever, Endocarditis, and Kawasaki Disease Committee. It includes new recommendations for the diagnosis and treatment of GAS pharyngitis, as well as for the secondary prevention of rheumatic fever, and classifies the strength of the recommendations and level of evidence supporting them. REPORT OF THE NATIONAL CONSENSUS CONFERENCE ON FAMILY PRESENCE DURING PEDIATRIC CARDIOPULMONARY RESUSCITATION AND PROCEDURES

Ambulatory Pediatric Association

INTRODUCTION. The National Consensus Conference on Family Presence during Pediatric Cardiopulmonary Resuscitation and Procedures was held in Washington, DC, on September 7–8, 2003. The concept, funding,

planning and organization for the conference were the Ambulatory Pediatric Association (APA) Presidential Project of James Seidel, M.D., Ph.D. Dr. Seidel was in the final stages of preparation for chairing the conference when he died on July 25, 2003. In Dr. Seidel's absence, the conference was chaired by Deborah Parkman Henderson R.N., PhD, his co-investigator, and Jane F. Knapp, M.D, a colleague.

The National Consensus Conference on Family Presence during Pediatric Procedures and Cardiopulmonary Resuscitation was funded by a grant to the APA from the Maternal Child Health Bureau (MCHB) Partnership for Children. This meeting brought together a panel of over 20 appointed representatives from a multidisciplinary, diverse group of national organizations interested in the emergency care of children. The conference was part of a multiphase process designed with the goal of publishing consensus guidelines useful for defining policy regarding family presence (FP) during pediatric procedures and CPR in the Emergency Department (ED). It is also possible that the consensus panel recommendations could be applied to other settings.

Panel members completed a review of the literature prior to attending the conference. This review, along with results of a pre-conference questionnaire, formed the basis of the discussion during the conference. During the two day conference the participants completed the outline of the guidelines presented here. We believe these recommendations are a powerful testimony to Dr. Seidel's vision for promoting FP through multidisciplinary consensus building. Beyond that vision, however, we hope that the guidelines will make a difference in improving the quality of children's health care. (9/03)

RESPONSE TO CARDIAC ARREST AND SELECTED LIFE-THREATENING MEDICAL EMERGENCIES: THE MEDICAL EMERGENCY RESPONSE PLAN FOR SCHOOLS. A STATEMENT FOR HEALTHCARE PROVIDERS, POLICYMAKERS, SCHOOL ADMINISTRATORS, AND COMMUNITY LEADERS

SCREENING FOR IDIOPATHIC SCOLIOSIS IN ADOLESCENTS

Pediatric Orthopaedic Society of North America, American Academy of Orthopaedic Surgeons, and Scoliosis Research Society

EXECUTIVE SUMMARY. Many states mandate school screening to identify children at risk for scoliosis, though recent studies have cast some controversy on the effectiveness of routine scoliosis screening. Previous studies have both supported and discouraged routine screening.

Prevention of severe scoliosis is a major commitment of physicians caring for children with spinal deformities. For this reason, the American Academy of Orthopaedic Surgeons (AAOS), the Scoliosis Research Society (SRS), the Pediatric Orthopaedic Society of North America

(POSNA), and the American Academy of Pediatrics (AAP) convened a task force to examine issues related to scoliosis screening and to put forth the present information statement. The societies acknowledge the important role of a systematic review of the literature as well as the role of consensus expert opinion in the common situation where the available evidence does not yet exist to speak definitely for, or against, an evaluation or intervention.

Costs involved with scoliosis screening are relatively low on a societal level and may justify the possibility of preventing surgery in adolescents with scoliosis. Adolescents without significant spinal deformity who are referred to a specialist for evaluation often do not require radiographs. For those who do need radiographic evaluation, it is important to know that the radiation exposure using current-day radiographic techniques, including digital radiography, is significantly smaller than in the past.

Opponents to scoliosis screening have focused on concerns about a low predictive value of screening and the cost-effectiveness of referral. There have also been concerns about the possibility of unnecessary treatment, including brace use, and the effect of exposure to radiation when radiographs are obtained.

With regard to early treatment in those adolescents detected with moderate scoliosis, the available data neither definitively support nor refute the efficacy of bracing. To most effectively answer this, a well-organized level I study is needed. Such a study, a five-year multicenter randomized controlled trial of bracing sponsored by the National Institutes of Health/National Institute of Arthritis and Musculoskeletal and Skin Diseases (NIH/NIAMS), is currently under way.

In 1996, the United States Preventive Services Task Force (USPSTF) concluded that there was insufficient evidence to make a recommendation for, or against, screening. However, in 2004, the USPSTF changed their position and recommended against the routine screening of asymptomatic adolescents for idiopathic scoliosis. The AAOS, SRS, POSNA, and AAP have concerns that this change in position by the USPSTF came in the absence of any significant change in the available literature, in the absence of any change in position statements by the AAOS, SRS, POSNA, and AAP, and in the absence of any significant input from specialists who commonly care for children with scoliosis.

As the primary care providers for adolescents with idiopathic scoliosis, the AAOS, SRS, POSNA, and AAP do not support any recommendation against scoliosis screening, given the available literature. (1/08)

SELECTED ISSUES FOR THE ADOLESCENT ATHLETE AND THE TEAM PHYSICIAN: A CONSENSUS STATEMENT

American Academy of Family Physicians, American Academy of Orthopaedic Surgeons, American College of Sports Medicine, American Medical Society for Sports Medicine, American Orthopaedic Society for Sports Medicine, and American Osteopathic Academy of Sports Medicine

GOAL. The goal of this document is to help the team physician improve the care of the adolescent athlete by understanding the medical, musculoskeletal and psycho-

logical factors common in this age group. To accomplish this goal, the team physician should have knowledge of and be involved with:

Musculoskeletal injuries of the adolescent athlete, specifically those to the shoulder, knee, elbow and spine

Medical conditions of the adolescent athlete, especially those pertaining to infectious diseases, concussion, and nutrition and supplementation

Psychological issues related to sports specialization and overtraining. (11/08)

SKIING AND SNOWBOARDING INJURY PREVENTION

Canadian Paediatric Society

ABSTRACT. Skiing and snowboarding are popular recreational and competitive sport activities for children and youth. Injuries associated with both activities are frequent and can be serious. There is new evidence documenting the benefit of wearing helmets while skiing and snowboarding, as well as data refuting suggestions that helmet use may increase the risk of neck injury. There is also evidence to support using wrist guards while snowboarding. There is poor uptake of effective preventive measures such as protective equipment use and related policy. Physicians should have the information required to counsel children, youth and families regarding safer snow sport participation, including helmet use, wearing wrist guards for snowboarding, training and supervision, the importance of proper equipment fitting and binding adjustment, sun safety and avoiding substance use while on the slopes. (1/12)

SUPPLEMENT TO THE JCIH 2007 POSITION STATEMENT: PRINCIPLES AND GUIDELINES FOR EARLY INTERVENTION AFTER CONFIRMATION THAT A CHILD IS DEAF OR HARD OF HEARING

Joint Committee on Infant Hearing

PREFACE. This document is a supplement to the recommendations in the year 2007 position statement of the Joint Committee on Infant Hearing (JCIH) and provides comprehensive guidelines for early hearing detection and intervention (EHDI) programs on establishing strong early intervention (EI) systems with appropriate expertise to meet the needs of children who are deaf or hard of hearing (D/HH).

EI services represent the purpose and goal of the entire EHDI process. Screening and confirmation that a child is D/HH are largely meaningless without appropriate, individualized, targeted and high-quality intervention. For the infant or young child who is D/HH to reach his or her full potential, carefully designed individualized intervention must be implemented promptly, utilizing service providers with optimal knowledge and skill levels and providing services on the basis of research, best practices, and proven models.

The delivery of EI services is complex and requires individualization to meet the identified needs of the child and family. Because of the diverse needs of the population of children who are D/HH and their families, well-controlled intervention studies are challenging. At this time, few comparative effectiveness studies have been conducted. Randomized controlled trials are particularly difficult for ethical reasons, making it challenging to estab-

lish causal links between interventions and outcomes. EI systems must partner with colleagues in research to document what works for children and families and to strengthen the evidence base supporting practices.

Despite limitations and gaps in the evidence, the literature does contain research studies in which all children who were D/HH had access to the same well-defined EI service. These studies indicate that positive outcomes are possible, and they provide guidance about key program components that appear to promote these outcomes. This EI services document, drafted by teams of professionals with extensive expertise in EI programs for children who are D/HH and their families, relied on literature searches, existing systematic reviews, and recent professional consensus statements in developing this set of guidelines.

Terminology presented a challenge throughout document development. The committee noted that many of the frequently occurring terms necessary within the supplement may not reflect the most contemporary understanding and/or could convey inaccurate meaning. Rather than add to the lack of clarity or consensus and to avoid introducing new terminology to stakeholders, the committee opted to use currently recognized terms consistently herein and will monitor the emergence and/or development of new descriptors before the next JCIH consensus statement.

For purposes of this supplement:

- Language refers to all spoken and signed languages.
- Early intervention (EI), according to part C of the Individuals with Disabilities Education Improvement Act (IDEA) of 2004, is the process of providing services, education, and support to young children who are deemed to have an established condition, those who are evaluated and deemed to have a diagnosed physical or mental condition (with a high probability of resulting in a developmental delay), those who have an existing delay, or those who are at risk of developing a delay or special need that may affect their development or impede their education.
- Communication is used in lieu of terms such as communication options, methods, opportunities, approaches, etc.
- Deaf or hard of hearing (D/HH) is intended to be inclusive of all children with congenital and acquired hearing loss, unilateral and bilateral hearing loss, all degrees of hearing loss from minimal to profound, and all types of hearing loss (sensorineural, auditory neuropathy spectrum disorder, permanent conductive, and mixed).
- Core knowledge and skills is used to describe the expertise needed to provide appropriate EI that will optimize the development and well-being of infants/children and their families. Core knowledge and skills will differ according to the roles of individuals within the EI system (eg, service coordinator or EI provider).

This supplement to JCIH 2007 focuses on the practices of EI providers outside of the primary medical care and specialty medical care realms, rather than including the full spectrum of necessary medical, audiologic, and educational interventions. For more information about the recommendations for medical follow-up, primary care surveillance for related medical conditions, and specialty medical care and monitoring, the reader is encouraged to reference the year 2007 position statement of the JCIH as well as any subsequent revision. When an infant is confirmed to be D/HH, the importance of ongoing medical and audiologic management and surveillance both in the medical home and with the hearing health professionals, the otolaryngologist and the audiologist, cannot be overstated. A comprehensive discussion of those services is beyond the scope of this document. (3/13)

TARGETED TUBERCULIN TESTING AND TREATMENT OF LATENT TUBERCULOSIS INFECTION

American Thoracic Society and Centers for Disease Control and Prevention (4/00) (The AAP endorses and accepts as its policy the sections of this statement as they relate to infants and children.)

Update of Newborn Screening and Therapy for Congenital Hypothyroidism (Clinical Report) (joint with Section on Endocrinology, American Thyroid Association, and Lawson Wilkins Pediatric Endocrine Society), 6/06, reaffirmed 12/11

COMMITTEE ON HOSPITAL CARE

Admission and Discharge Guidelines for the Pediatric Patient Requiring Intermediate Care (Clinical Report) (joint with Section on Critical Care and Society of Critical Care Medicine), 5/04, reaffirmed 2/08, 1/13

Child Life Services (joint with Child Life Council), 4/14

Facilities and Equipment for the Care of Pediatric Patients in a Community Hospital (Clinical Report), 5/03, reaffirmed 5/07, 8/13

Guidelines for Developing Admission and Discharge Policies for the Pediatric Intensive Care Unit (Clinical Report) (joint with Section on Critical Care and Society of Critical Care Medicine), 4/99, reaffirmed 5/05, 2/08, 1/13

Medical Staff Appointment and Delineation of Pediatric Privileges in Hospitals (Clinical Report) (joint with Section on Hospital Medicine), 3/12

Palliative Care for Children (joint with Committee on Bioethics), 8/00, reaffirmed 6/03, 10/06, 2/12

Patient- and Family-Centered Care and the Pediatrician's Role (joint with Institute for Patient- and Family-Centered Care), 1/12

Pediatric Observation Units (Clinical Report) (joint with Committee on Pediatric Emergency Medicine), 6/12

Pediatric Organ Donation and Transplantation (joint with Section on Surgery and Section on Critical Care), 3/10, reaffirmed 3/14

Pediatric Palliative Care and Hospice Care Commitments, Guidelines, and Recommendations (joint with Section on Hospice and Palliative Medicine), 10/13

Physicians' Roles in Coordinating Care of Hospitalized Children (Clinical Report) (joint with Section on Hospital Medicine), 9/10

Precertification Process, 8/00, reaffirmed 5/05, 11/08

Principles of Pediatric Patient Safety: Reducing Harm Due to Medical Care (joint with Steering Committee on Quality Improvement and Management), 5/11

COMMITTEE ON INFECTIOUS DISEASES

Additional Recommendations for Use of Tetanus Toxoid, Reduced-Content Diphtheria Toxoid, and Acellular Pertussis Vaccine (Tdap), 9/11

Chemical-Biological Terrorism and Its Impact on Children (joint with Committee on Environmental Health), 9/06, reaffirmed 1/11

Clostridium difficile Infection in Infants and Children, 12/12

Cochlear Implants in Children: Surgical Site Infections and Prevention and Treatment of Acute Otitis Media and Meningitis (joint with Section on Otolaryngology–Head and Neck Surgery), 7/10

Consumption of Raw or Unpasteurized Milk and Milk Products by Pregnant Women and Children (joint with Committee on Nutrition), 12/13

Drinking Water From Private Wells and Risks to Children (joint with Committee on Environmental Health), 5/09, reaffirmed 1/13

Drinking Water From Private Wells and Risks to Children (Technical Report) (joint with Committee on Environmental Health), 5/09, reaffirmed 1/13

Epidemiology and Diagnosis of Health Care–Associated Infections in the NICU (Technical Report) (joint with Committee on Fetus and Newborn), 3/12

Exposure to Nontraditional Pets at Home and to Animals in Public Settings: Risks to Children (Clinical Report), 10/08, reaffirmed 12/11

Guidance on Management of Asymptomatic Neonates Born to Women With Active Genital Herpes Lesions (Clinical Report) (joint with Committee on Fetus and Newborn), 1/13

Head Lice (Clinical Report) (joint with Council on School Health), 7/10

HPV Vaccine Recommendations, 2/12

Immunization for *Streptococcus pneumoniae* Infections in High-Risk Children, 11/14

Immunizing Parents and Other Close Family Contacts in the Pediatric Office Setting (Technical Report) (joint with Committee on Practice and Ambulatory Medicine), 12/11

Infection Prevention and Control in Pediatric Ambulatory Settings, 9/07, reaffirmed 8/10

Interferon- γ Release Assays for Diagnosis of Tuberculosis Infection and Disease in Children (Technical Report), 11/14

Meningococcal Conjugate Vaccines Policy Update: Booster Dose Recommendations, 11/11

Nontherapeutic Use of Antimicrobial Agents in Animal Agriculture: Implications for Pediatrics (Technical Report) (joint with Committee on Environmental Health), 9/04, reaffirmed 10/08, 4/13

Pediatric Anthrax Clinical Management (Clinical Report) (joint with Disaster Preparedness Advisory Council), 4/14

Pediatric Anthrax Clinical Management: Executive Summary (Clinical Report) (joint with Disaster Preparedness Advisory Council), 4/14

Poliovirus, 9/11

Prevention of Rotavirus Disease: Updated Guidelines for Use of Rotavirus Vaccine, 3/09

Prevention of Varicella: Update of Recommendations for Use of Quadrivalent and Monovalent Varicella Vaccines in Children, 8/11

Principles of Judicious Antibiotic Prescribing for Upper Respiratory Tract Infections in Pediatrics (Clinical Report), 11/13

Rabies-Prevention Policy Update: New Reduced-Dose Schedule, 3/11

Recommendation for Mandatory Influenza Immunization of All Health Care Personnel, 9/10

Recommendations for Administering Hepatitis A Vaccine to Contacts of International Adoptees, 9/11

Recommendations for Prevention and Control of Influenza in Children, 2014–2015, 10/14

Recommendations for the Prevention of Perinatal Group B Streptococcal (GBS) Disease (joint with Committee on Fetus and Newborn), 8/11

Recommendations for the Prevention of *Streptococcus pneumoniae* Infections in Infants and Children: Use of 13-Valent Pneumococcal Conjugate Vaccine (PCV13) and Pneumococcal Polysaccharide Vaccine (PPSV23), 5/10

Recommended Childhood and Adolescent Immunization Schedule—United States, 2015, 1/15

Strategies for Prevention of Health Care–Associated Infections in the NICU (Clinical Report) (joint with Committee on Fetus and Newborn), 3/12

Updated Guidance for Palivizumab Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for Respiratory Syncytial Virus Infection (joint with Bronchiolitis Guidelines Committee), 7/14

Updated Guidance for Palivizumab Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for Respiratory Syncytial Virus Infection (Technical Report) (joint with Bronchiolitis Guidelines Committee), 7/14

Updated Recommendations on the Use of Meningococcal Vaccines, 7/14

The Use of Systemic and Topical Fluoroquinolones (Clinical Report), 9/11

COMMITTEE ON MEDICAL LIABILITY AND RISK MANAGEMENT

Consent by Proxy for Nonurgent Pediatric Care (Clinical Report), 10/10

Dealing With the Parent Whose Judgment Is Impaired by Alcohol or Drugs: Legal and Ethical Considerations (Clinical Report), 9/04, reaffirmed 9/10

Expert Witness Participation in Civil and Criminal Proceedings, 6/09

The Pediatrician and Disaster Preparedness (joint with Committee on Pediatric Emergency Medicine and Task Force on Terrorism), 2/06, reaffirmed 6/09, 9/13

Professional Liability Insurance and Medicolegal Education for Pediatric Residents and Fellows, 8/11

COMMITTEE ON NATIVE AMERICAN CHILD HEALTH

Early Childhood Caries in Indigenous Communities (joint with Canadian Paediatric Society), 5/11

Ethical Considerations in Research With Socially Identifiable Populations (joint with Committee on Community Health Services), 1/04, reaffirmed 10/07, 1/13

Health Equity and Children's Rights (joint with Council on Community Pediatrics), 3/10, reaffirmed 10/13

Inhalant Abuse (Clinical Report) (joint with Committee on Substance Abuse), 5/07

Prevention and Treatment of Type 2 Diabetes Mellitus in Children, With Special Emphasis on American Indian and Alaska Native Children (Clinical Report) (joint with Section on Endocrinology), 10/03, reaffirmed 10/08

The Prevention of Unintentional Injury Among American Indian and Alaska Native Children: A Subject Review (Clinical Report) (joint with Committee on Injury and Poison Prevention), 12/99, reaffirmed 5/03, 1/06, 1/09

Secondhand and Prenatal Tobacco Smoke Exposure (Technical Report) (joint with Committee on Environmental Health and Committee on Adolescence), 10/09, reaffirmed 5/14

Tobacco Use: A Pediatric Disease (joint with Committee on Environmental Health, Committee on Substance Abuse, and Committee on Adolescence), 10/09, reaffirmed 5/13

COMMITTEE ON NUTRITION

Calcium and Vitamin D Requirements of Enterally Fed Preterm Infants (Clinical Report), 4/13

Consumption of Raw or Unpasteurized Milk and Milk Products by Pregnant Women and Children (joint with Committee on Infectious Diseases), 12/13

Diagnosis and Prevention of Iron Deficiency and Iron-Deficiency Anemia in Infants and Young Children (0–3 Years of Age) (Clinical Report), 10/10

Effects of Early Nutritional Interventions on the Development of Atopic Disease in Infants and Children: The Role of Maternal Dietary Restriction, Breastfeeding, Timing of Introduction of Complementary Foods, and Hydrolyzed Formulas (Clinical Report) (joint with Section on Allergy and Immunology), 1/08

Failure to Thrive as a Manifestation of Child Neglect (Clinical Report) (joint with Committee on Child Abuse and Neglect), 11/05, reaffirmed 1/09

Infant Methemoglobinemia: The Role of Dietary Nitrate in Food and Water (Clinical Report) (joint with Committee on Environmental Health), 9/05, reaffirmed 4/09

Lactose Intolerance in Infants, Children, and Adolescents (Clinical Report), 9/06, reaffirmed 8/12

Optimizing Bone Health in Children and Adolescents (Clinical Report), 9/14

Organic Foods: Health and Environmental Advantages and Disadvantages (Clinical Report) (joint with Council on Environmental Health), 10/12

Prevention of Pediatric Overweight and Obesity, 8/03, reaffirmed 10/06

Probiotics and Prebiotics in Pediatrics (Clinical Report) (joint with Section on Gastroenterology, Hepatology, and Nutrition), 11/10

Reimbursement for Foods for Special Dietary Use, 5/03, reaffirmed 1/06

Sports Drinks and Energy Drinks for Children and Adolescents: Are They Appropriate? (Clinical Report) (joint with Council on Sports Medicine and Fitness), 5/11

The Use and Misuse of Fruit Juice in Pediatrics, 5/01, reaffirmed 10/06, 8/13

Use of Soy Protein-Based Formulas in Infant Feeding (Clinical Report), 5/08

COMMITTEE ON PEDIATRIC AIDS

Adolescents and HIV Infection: The Pediatrician's Role in Promoting Routine Testing, 10/11

Adolescents and Human Immunodeficiency Virus Infection: The Role of the Pediatrician in Prevention and Intervention (joint with Committee on Adolescence), 1/01, reaffirmed 10/03, 1/05

Diagnosis of HIV-1 Infection in Children Younger Than 18 Months in the United States (Technical Report), 12/07, reaffirmed 4/10

Disclosure of Illness Status to Children and Adolescents With HIV Infection, 1/99, reaffirmed 2/02, 5/05, 1/09, 1/12

Education of Children With Human Immunodeficiency Virus Infection, 6/00, reaffirmed 3/03, 10/06, 4/10, 3/13

Evaluation and Management of the Infant Exposed to HIV-1 in the United States (Clinical Report), 12/08

HIV Testing and Prophylaxis to Prevent Mother-to-Child Transmission in the United States, 11/08, reaffirmed 6/11

Human Immunodeficiency Virus Screening (joint with Committee on Fetus and Newborn and American College of Obstetricians and Gynecologists), 7/99, reaffirmed 6/02, 5/05, 10/08, 5/12

Human Milk, Breastfeeding, and Transmission of Human Immunodeficiency Virus in the United States, 11/95, reaffirmed 11/99, 11/03, 2/08

Human Milk, Breastfeeding, and Transmission of Human Immunodeficiency Virus Type 1 in the United States (Technical Report), 11/03, reaffirmed 1/07

Identification and Care of HIV-Exposed and HIV-Infected Infants, Children, and Adolescents in Foster Care, 7/00, reaffirmed 3/03, 2/08, 6/11

Increasing Antiretroviral Drug Access for Children With HIV Infection (joint with Section on International Child Health), 4/07, reaffirmed 4/10

Infant Feeding and Transmission of Human Immunodeficiency Virus in the United States, 1/13

Postexposure Prophylaxis in Children and Adolescents for Nonoccupational Exposure to Human Immunodeficiency Virus (Clinical Report), 6/03, reaffirmed 1/07, 10/08

Psychosocial Support for Youth Living With HIV (Clinical Report), 2/14

Reducing the Risk of HIV Infection Associated With Illicit Drug Use, 2/06, reaffirmed 5/09, 5/12

Surveillance of Pediatric HIV Infection, 2/98, reaffirmed 2/02, 1/06, 1/11

Transitioning HIV-Infected Youth Into Adult Health Care, 6/13

COMMITTEE ON PEDIATRIC EMERGENCY MEDICINE

Access to Optimal Emergency Care for Children, 1/07, reaffirmed 8/10, 7/14

Consent for Emergency Medical Services for Children and Adolescents (joint with Committee on Bioethics), 7/11

Death of a Child in the Emergency Department (joint with American College of Emergency Physicians and Emergency Nurses Association), 6/14

Death of a Child in the Emergency Department (Technical Report) (joint with American College of Emergency Physicians and Emergency Nurses Association), 6/14

Dispensing Medications at the Hospital Upon Discharge From an Emergency Department (Technical Report), 1/12

Emergency Information Forms and Emergency Preparedness for Children With Special Health Care Needs (joint with Council on Clinical Information Technology and American College of Emergency Physicians Pediatric Emergency Medicine Committee), 3/10, reaffirmed 7/14

Guidelines for Care of Children in the Emergency Department (joint with American College of Emergency Physicians and Emergency Nurses Association), 9/09, reaffirmed 4/13

Management of Pediatric Trauma (joint with Section on Orthopaedics, Section on Critical Care, Section on Surgery, Section on Transport Medicine, and Pediatric Orthopaedic Society of North America), 4/08, reaffirmed 4/13

Overcrowding Crisis in Our Nation's Emergency Departments: Is Our Safety Net Unraveling?, 9/04, reaffirmed 5/07, 6/11

Patient- and Family-Centered Care and the Role of the Emergency Physician Providing Care to a Child in the Emergency Department (joint with American College of Emergency Physicians), 11/06, reaffirmed 6/09, 10/11

Patient- and Family-Centered Care of Children in the Emergency Department (Technical Report), 8/08

Patient Safety in the Pediatric Emergency Care Setting, 12/07, reaffirmed 6/11, 7/14

Pediatric and Adolescent Mental Health Emergencies in the Emergency Medical Services System (Technical Report), 4/11, 7/14

Pediatric Care Recommendations for Freestanding Urgent Care Facilities, 4/14

Pediatric Mental Health Emergencies in the Emergency Medical Services System (joint with American College of Emergency Physicians), 10/06, reaffirmed 6/09, 4/13

Pediatric Observation Units (Clinical Report) (joint with Committee on Hospital Care), 6/12

The Pediatrician and Disaster Preparedness (joint with Committee on Medical Liability and Task Force on Terrorism), 2/06, reaffirmed 6/09, 9/13

Preparation for Emergencies in the Offices of Pediatricians and Pediatric Primary Care Providers, 7/07, reaffirmed 6/11

Relief of Pain and Anxiety in Pediatric Patients in Emergency Medical Systems (Clinical Report) (joint with Section on Anesthesiology and Pain Medicine), 10/12

Role of Pediatricians in Advocating Life Support Training Courses for Parents and the Public, 12/04, reaffirmed 5/07, 8/10, 8/13

Role of Pediatricians in Advocating Life Support Training Courses for Parents and the Public (Technical Report), 12/04, reaffirmed 5/07, 8/10, reaffirmed 1/14

The Role of the Pediatrician in Rural Emergency Medical Services for Children, 10/12

Ventricular Fibrillation and the Use of Automated External Defibrillators on Children (joint with Section on Cardiology and Cardiac Surgery), 11/07, reaffirmed 6/11, 7/14

Withholding or Termination of Resuscitation in Pediatric Out-of-Hospital Traumatic Cardiopulmonary Arrest (joint with American College of Surgeons and National Association of EMS Physicians), 3/14

COMMITTEE ON PEDIATRIC RESEARCH

Guidelines for the Ethical Conduct of Studies to Evaluate Drugs in Pediatric Populations (Clinical Report) (joint with Committee on Drugs), 3/10, reaffirmed 1/14

Human Embryonic Stem Cell (hESC) and Human Embryo Research (joint with Committee on Bioethics), 10/12

Promoting Education, Mentorship, and Support for Pediatric Research, 4/14

Race/Ethnicity, Gender, Socioeconomic Status—Research Exploring Their Effects on Child Health: A Subject Review (Clinical Report), 6/00, reaffirmed 10/05, 1/09

Racial and Ethnic Disparities in the Health and Health Care of Children (Technical Report), 3/10, reaffirmed 5/13

COMMITTEE ON PEDIATRIC WORKFORCE

Enhancing Pediatric Workforce Diversity and Providing Culturally Effective Pediatric Care: Implications for Practice, Education, and Policy Making, 9/13

Financing Graduate Medical Education to Meet the Needs of Children and the Future Pediatrician Workforce, 4/08, reaffirmed 1/12

Nondiscrimination in Pediatric Health Care, 10/07, reaffirmed 6/11

Pediatric Primary Health Care, 1/11, reaffirmed 10/13

The Pediatrician Workforce: Current Status and Future Prospects (Technical Report), 7/05

Pediatrician Workforce Policy Statement, 7/13

Prevention of Sexual Harassment in the Workplace and Educational Settings, 10/06, reaffirmed 5/09, 1/12

Scope of Practice Issues in the Delivery of Pediatric Health Care, 5/13

COMMITTEE ON PRACTICE AND AMBULATORY MEDICINE

2014 Recommendations for Pediatric Preventive Health Care (joint with Bright Futures Periodicity Schedule Workgroup), 2/14

AAP Principles Concerning Retail-Based Clinics, 2/14

Eye Examination in Infants, Children, and Young Adults by Pediatricians (joint with Section on Ophthalmology, American Association of Certified Orthoptists, American Association for Pediatric Ophthalmology and Strabismus, and American Academy of Ophthalmology), 4/03, reaffirmed 5/07

Hearing Assessment in Infants and Children: Recommendations Beyond Neonatal Screening (Clinical Report) (joint with Section on Otolaryngology–Head and Neck Surgery), 9/09

Immunization Information Systems, 9/06, reaffirmed 10/11

Immunizing Parents and Other Close Family Contacts in the Pediatric Office Setting (Technical Report) (joint with Committee on Infectious Diseases), 12/11

Increasing Immunization Coverage (joint with Council on Community Pediatrics), 5/10

Instrument-Based Pediatric Vision Screening Policy Statement (joint with Section on Ophthalmology, American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 10/12

Physician Health and Wellness (Clinical Report) (joint with Section on Integrative Medicine), 9/14

Prevention and Management of Positional Skull Deformities in Infants (Clinical Report) (joint with Section on Neurological Surgery), 11/11

Principles for the Development and Use of Quality Measures (joint with Steering Committee on Quality Improvement and Management), 2/08

Recommendations for Preventive Pediatric Health Care (joint with Bright Futures Steering Committee), 12/07, reaffirmed 1/11

Use of Chaperones During the Physical Examination of the Pediatric Patient, 4/11

COMMITTEE ON PSYCHOSOCIAL ASPECTS OF CHILD AND FAMILY HEALTH

Coparent or Second-Parent Adoption by Same-Sex Parents, 2/02, reaffirmed 5/09

Coparent or Second-Parent Adoption by Same-Sex Parents (Technical Report), 2/02, reaffirmed 5/09

Early Childhood Adversity, Toxic Stress, and the Role of the Pediatrician: Translating Developmental Science Into Lifelong Health (joint with Committee on Early Childhood, Adoption, and Dependent Care and Section on Developmental and Behavioral Pediatrics), 12/11

Fathers and Pediatricians: Enhancing Men's Roles in the Care and Development of Their Children (Clinical Report), 5/04, reaffirmed 8/13

The Future of Pediatrics: Mental Health Competencies for Pediatric Primary Care (joint with Task Force on Mental Health), 6/09, reaffirmed 8/13

Guidance for Effective Discipline, 4/98, reaffirmed 3/01, 1/05, 5/12, 4/14

Health and Mental Health Needs of Children in US Military Families (Clinical Report) (joint with Section on Uniformed Services), 5/13

Helping Children and Families Deal With Divorce and Separation (Clinical Report), 11/02, reaffirmed 1/06

The Importance of Play in Promoting Healthy Child Development and Maintaining Strong Parent-Child Bonds (Clinical Report) (joint with Committee on Communications), 1/07

The Importance of Play in Promoting Healthy Child Development and Maintaining Strong Parent-Child Bond: Focus on Children in Poverty (Clinical Report) (joint with Council on Communications and Media), 12/11

Incorporating Recognition and Management of Perinatal and Postpartum Depression Into Pediatric Practice (Clinical Report), 10/10

The Lifelong Effects of Early Childhood Adversity and Toxic Stress (Technical Report) (joint with Committee on Early Childhood, Adoption, and Dependent Care and Section on Developmental and Behavioral Pediatrics), 12/11

The New Morbidity Revisited: A Renewed Commitment to the Psychosocial Aspects of Pediatric Care, 11/01

The Pediatrician and Childhood Bereavement, 2/00, reaffirmed 1/04, 3/13

The Pediatrician's Role in the Prevention of Missing Children (Clinical Report), 10/04

The Prenatal Visit (Clinical Report), 9/09, reaffirmed 5/14

Promoting the Well-Being of Children Whose Parents Are Gay or Lesbian, 3/13

Promoting the Well-Being of Children Whose Parents Are Gay or Lesbian (Technical Report), 3/13

Psychosocial Implications of Disaster or Terrorism on Children: A Guide for the Pediatrician (Clinical Report) (joint with Task Force on Terrorism), 9/05

Psychosocial Risks of Chronic Health Conditions in Childhood and Adolescence (joint with Committee on Children With Disabilities), 12/93, reaffirmed 10/96

Sexuality Education for Children and Adolescents (joint with Committee on Adolescence), 8/01, reaffirmed 10/04

Supporting the Family After the Death of a Child (Clinical Report), 11/12

COMMITTEE ON SUBSTANCE ABUSE

Alcohol Use by Youth and Adolescents: A Pediatric Concern, 4/10

Attention-Deficit/Hyperactivity Disorder and Substance Abuse (Clinical Report), 6/14

Improving Substance Abuse Prevention, Assessment, and Treatment Financing for Children and Adolescents (joint with Committee on Child Health Financing), 10/01

Indications for Management and Referral of Patients Involved in Substance Abuse, 7/00

Inhalant Abuse (Clinical Report) (joint with Committee on Native American Child Health), 5/07

Legalization of Marijuana: Potential Impact on Youth (joint with Committee on Adolescence), 6/04

Legalization of Marijuana: Potential Impact on Youth (Technical Report) (joint with Committee on Adolescence), 6/04

Marijuana: A Continuing Concern for Pediatricians, 10/99, reaffirmed 4/03

Prenatal Substance Abuse: Short- and Long-term Effects on the Exposed Fetus (Technical Report) (joint with Committee on Fetus and Newborn), 2/13

The Role of Schools in Combating Illicit Substance Abuse (joint with Council on School Health), 12/07

Substance Use Screening, Brief Intervention, and Referral to Treatment for Pediatricians, 10/11

Testing for Drugs of Abuse in Children and Adolescents (Clinical Report), 5/14

Tobacco, Alcohol, and Other Drugs: The Role of the Pediatrician in Prevention, Identification, and Management of Substance Abuse (Clinical Report), 3/05, reaffirmed 3/13

Tobacco as a Substance of Abuse (Technical Report), 10/09

Tobacco Use: A Pediatric Disease (joint with Committee on Environmental Health, Committee on Adolescence, and Committee on Native American Child Health), 10/09, reaffirmed 5/13

COUNCIL ON CHILDREN WITH DISABILITIES (FORMERLY COMMITTEE ON CHILDREN WITH DISABILITIES AND SECTION ON CHILDREN WITH DISABILITIES)

Auditory Integration Training and Facilitated Communication for Autism, 8/98, reaffirmed 5/02, 1/06, 12/09

Care Coordination in the Medical Home: Integrating Health and Related Systems of Care for Children With Special Health Care Needs, 11/05

Counseling Families Who Choose Complementary and Alternative Medicine for Their Child With Chronic Illness or Disability, 3/01, reaffirmed 1/05, 5/10

Early Intervention, IDEA Part C Services, and the Medical Home: Collaboration for Best Practice and Best Outcomes (Clinical Report), 9/13

Guidelines for Home Care of Infants, Children, and Adolescents With Chronic Disease, 7/95, reaffirmed 4/00, 1/06

Home Care of Children and Youth With Complex Health Care Needs and Technology Dependencies (Clinical Report), 4/12

Identification and Evaluation of Children With Autism Spectrum Disorders (Clinical Report), 11/07, reaffirmed 9/10, 8/14

Identifying Infants and Young Children With Developmental Disorders in the Medical Home: An Algorithm for Developmental Surveillance and Screening (joint with Section on Developmental and Behavioral Pediatrics, Bright Futures Steering Committee, and Medical Home Initiatives for Children With Special Needs Project Advisory Committee), 7/06, reaffirmed 12/09, 8/14

Learning Disabilities, Dyslexia, and Vision (joint with Section on Ophthalmology, American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 7/09, reaffirmed 7/14

Learning Disabilities, Dyslexia, and Vision (Technical Report) (joint with Section on Ophthalmology, American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 3/11

Maltreatment of Children With Disabilities (Clinical Report) (joint with Committee on Child Abuse and Neglect), 5/07, reaffirmed 1/11

Management of Children With Autism Spectrum Disorders (Clinical Report), 11/07, reaffirmed 9/10, 8/14

Nonoral Feeding for Children and Youth With Developmental or Acquired Disabilities (Clinical Report), 11/14

Oral Health Care for Children With Developmental Disabilities (Clinical Report) (joint with Section on Oral Health), 2/13

Out-of-Home Placement for Children and Adolescents With Disabilities (Clinical Report), 9/14

Parent-Provider-Community Partnerships: Optimizing Outcomes for Children With Disabilities (Clinical Report), 9/11

Patient- and Family-Centered Care Coordination: A Framework for Integrating Care for Children and Youth Across Multiple Systems (joint with Medical Home Implementation Project Advisory Committee), 4/14

The Pediatrician's Role in Development and Implementation of an Individual Education Plan (IEP) and/or an Individual Family Service Plan (IFSP), 7/99, reaffirmed 11/02, 1/06

Prescribing Assistive-Technology Systems: Focus on Children With Impaired Communication (Clinical Report), 6/08, reaffirmed 1/12

Prescribing Therapy Services for Children With Motor Disabilities (Clinical Report), 6/04, reaffirmed 5/07, 5/11

Promoting the Participation of Children With Disabilities in Sports, Recreation, and Physical Activities (Clinical Report), 5/08, reaffirmed 1/12

Providing a Primary Care Medical Home for Children and Youth With Cerebral Palsy (Clinical Report), 10/11

Providing a Primary Care Medical Home for Children and Youth With Spina Bifida (Clinical Report), 11/11

Provision of Educationally Related Services for Children and Adolescents With Chronic Diseases and Disabling Conditions, 6/07

Psychosocial Risks of Chronic Health Conditions in Childhood and Adolescence (joint with Committee on Psychosocial Aspects of Child and Family Health), 12/93, reaffirmed 10/96

Role of the Medical Home in Family-Centered Early Intervention Services, 11/07

Sensory Integration Therapies for Children With Developmental and Behavioral Disorders (joint with Section on Complementary and Integrative Medicine), 5/12

Sexuality of Children and Adolescents With Developmental Disabilities (Clinical Report), 7/06, reaffirmed 12/09, 7/13

Supplemental Security Income (SSI) for Children and Youth With Disabilities, 11/09

The Treatment of Neurologically Impaired Children Using Patterning, 11/99, reaffirmed 11/02, 1/06, 8/10, 4/14

COUNCIL ON CLINICAL INFORMATION TECHNOLOGY (FORMERLY STEERING COMMITTEE ON CLINICAL INFORMATION TECHNOLOGY, SECTION ON COMPUTERS AND OTHER TECHNOLOGIES, AND TASK FORCE ON MEDICAL INFORMATICS)

Electronic Prescribing Systems in Pediatrics: The Rationale and Functionality Requirements, 6/07

Electronic Prescribing Systems in Pediatrics: The Rationale and Functionality Requirements (Technical Report), 6/07

Electronic Prescribing in Pediatrics: Toward Safer and More Effective Medication Management, 3/13

Electronic Prescribing in Pediatrics: Toward Safer and More Effective Medication Management (Technical Report), 3/13

Emergency Information Forms and Emergency Preparedness for Children With Special Health Care Needs (joint with Committee on Pediatric Emergency Medicine and American College of Emergency Physicians Pediatric Emergency Medicine Committee), 3/10, reaffirmed 7/14

Health Information Technology and the Medical Home, 4/11

Pediatric Aspects of Inpatient Health Information Technology Systems (Technical Report), 12/08

Special Requirements of Electronic Health Record Systems in Pediatrics (Clinical Report), 3/07, reaffirmed 5/12

Standards for Health Information Technology to Ensure Adolescent Privacy (joint with Committee on Adolescence), 10/12

COUNCIL ON COMMUNICATIONS AND MEDIA (FORMERLY COMMITTEE ON COMMUNICATIONS AND COMMITTEE ON PUBLIC EDUCATION)

Children, Adolescents, and Advertising, 12/06, reaffirmed 3/10

Children, Adolescents, and Television, 2/01

Children, Adolescents, and the Media, 10/13

Children, Adolescents, Obesity, and the Media, 7/11

Children, Adolescents, Substance Abuse, and the Media, 9/10

Impact of Music, Music Lyrics, and Music Videos on Children and Youth, 10/09

The Impact of Social Media on Children, Adolescents, and Families (Clinical Report), 3/11

The Importance of Play in Promoting Healthy Child Development and Maintaining Strong Parent-Child Bonds (Clinical Report) (joint with Committee on Psychosocial Aspects of Child and Family Health), 1/07

The Importance of Play in Promoting Healthy Child Development and Maintaining Strong Parent-Child Bond: Focus on Children in Poverty (Clinical Report) (joint with Committee on Psychosocial Aspects of Child and Family Health), 12/11

Media Education, 9/10

Media Use by Children Younger Than 2 Years, 10/11

Media Violence, 10/09

Sexuality, Contraception, and the Media, 8/10

COUNCIL ON COMMUNITY PEDIATRICS (FORMERLY COMMITTEE ON COMMUNITY HEALTH SERVICES)

Child Fatality Review (joint with Committee on Child Abuse and Neglect and Committee on Injury, Violence, and Poison Prevention), 8/10, reaffirmed 5/14

Community Pediatrics: Navigating the Intersection of Medicine, Public Health, and Social Determinants of Children's Health, 2/13

Ethical Considerations in Research With Socially Identifiable Populations (joint with Committee on Native American Child Health), 1/04, reaffirmed 10/07, 1/13

Health Equity and Children's Rights (joint with Committee on Native American Child Health), 3/10, reaffirmed 10/13

Increasing Immunization Coverage (joint with Committee on Practice and Ambulatory Medicine), 5/10

The Pediatrician's Role in Community Pediatrics, 4/05, reaffirmed 1/10

Prevention of Agricultural Injuries Among Children and Adolescents (joint with Committee on Injury and Poison Prevention), 10/01, reaffirmed 1/07, 11/11

Providing Care for Children and Adolescents Facing Homelessness and Housing Insecurity, 5/13

Providing Care for Immigrant, Migrant, and Border Children, 5/13

The Role of Preschool Home-Visiting Programs in Improving Children's Developmental and Health Outcomes, 1/09

COUNCIL ON EARLY CHILDHOOD (FORMERLY COMMITTEE ON EARLY CHILDHOOD, ADOPTION, AND DEPENDENT CARE AND COMMITTEE ON EARLY CHILDHOOD)

Care of Adolescent Parents and Their Children (Clinical Report) (joint with Committee on Adolescence), 11/12

Comprehensive Health Evaluation of the Newly Adopted Child (Clinical Report), 12/11

Early Childhood Adversity, Toxic Stress, and the Role of the Pediatrician: Translating Developmental Science Into Lifelong Health (joint with Committee on Psychosocial Aspects of Child and Family Health and Section on Developmental and Behavioral Pediatrics), 12/11

Families and Adoption: The Pediatrician's Role in Supporting Communication (Clinical Report), 12/03

Health Care of Youth Aging Out of Foster Care (joint with Council on Foster Care, Adoption, and Kinship Care), 11/12

The Inappropriate Use of School "Readiness" Tests (joint with Committee on School Health), 3/95, reaffirmed 4/98, 1/04, 4/10

The Lifelong Effects of Early Childhood Adversity and Toxic Stress (Technical Report) (joint with Committee on Psychosocial Aspects of Child and Family Health and Section on Developmental and Behavioral Pediatrics), 12/11

Literacy Promotion: An Essential Component of Primary Care Pediatric Practice, 7/14

Parental Leave for Residents and Pediatric Training Programs (joint with Section on Medical Students, Residents, and Fellowship Trainees), 1/13

The Pediatrician's Role in Family Support and Family Support Programs, 11/11

The Pediatrician's Role in Supporting Adoptive Families (Clinical Report) (joint with Council on Foster Care, Adoption, and Kinship Care), 9/12

Quality Early Education and Child Care From Birth to Kindergarten, 1/05, reaffirmed 12/09

School Readiness (Technical Report) (joint with Council on School Health), 4/08, reaffirmed 9/13

Selecting Appropriate Toys for Young Children: The Pediatrician's Role (Clinical Report), 4/03, reaffirmed 10/06, 5/11

COUNCIL ON ENVIRONMENTAL HEALTH (FORMERLY COMMITTEE ON ENVIRONMENTAL HEALTH)

Ambient Air Pollution: Health Hazards to Children, 12/04, reaffirmed 4/09

The Built Environment: Designing Communities to Promote Physical Activity in Children, 5/09, reaffirmed 1/13

Chemical-Biological Terrorism and Its Impact on Children (joint with Committee on Infectious Diseases), 9/06, reaffirmed 1/11

Chemical-Management Policy: Prioritizing Children's Health, 4/11

Drinking Water From Private Wells and Risks to Children (joint with Committee on Infectious Diseases), 5/09, reaffirmed 1/13

Drinking Water From Private Wells and Risks to Children (Technical Report) (joint with Committee on Infectious Diseases), 5/09, reaffirmed 1/13

Global Climate Change and Children's Health, 11/07, reaffirmed 5/12

Global Climate Change and Children's Health (Technical Report), 11/07, reaffirmed 5/12

Infant Methemoglobinemia: The Role of Dietary Nitrate in Food and Water (Clinical Report) (joint with Committee on Nutrition), 9/05, reaffirmed 4/09

Iodine Deficiency, Pollutant Chemicals, and the Thyroid: New Information on an Old Problem, 5/14

Nontherapeutic Use of Antimicrobial Agents in Animal Agriculture: Implications for Pediatrics (Technical Report) (joint with Committee on Infectious Diseases), 9/04, reaffirmed 10/08, 4/13

Organic Foods: Health and Environmental Advantages and Disadvantages (Clinical Report) (joint with Committee on Nutrition), 10/12

Pesticide Exposure in Children, 11/12

Pesticide Exposure in Children (Technical Report), 11/12

Radiation Disasters and Children, 6/03, reaffirmed 1/07

Secondhand and Prenatal Tobacco Smoke Exposure (Technical Report) (joint with Committee on Native American Child Health and Committee on Adolescence), 10/09, reaffirmed 5/14

Spectrum of Noninfectious Health Effects From Molds, 12/06, reaffirmed 1/11

Spectrum of Noninfectious Health Effects From Molds (Technical Report), 12/06, reaffirmed 1/11

Tobacco Use: A Pediatric Disease (joint with Committee on Substance Abuse, Committee on Adolescence, and Committee on Native American Child Health), 10/09, reaffirmed 5/13

Ultraviolet Radiation: A Hazard to Children and Adolescents (joint with Section on Dermatology), 2/11

Ultraviolet Radiation: A Hazard to Children and Adolescents (Technical Report) (joint with Section on Dermatology), 3/11

COUNCIL ON FOSTER CARE, ADOPTION, AND KINSHIP CARE (FORMER SECTION ON ADOPTION AND FOSTER CARE, TASK FORCE ON FOSTER CARE, AND COMMITTEE ON EARLY CHILDHOOD, ADOPTION, AND DEPENDENT CARE)

Health Care of Youth Aging Out of Foster Care (joint with Committee on Early Childhood), 11/12

The Pediatrician's Role in Supporting Adoptive Families (Clinical Report) (joint with Committee on Early Childhood), 9/12

Understanding the Behavioral and Emotional Consequences of Child Abuse (Clinical Report) (joint with Committee on Child Abuse and Neglect, American Academy of Child and Adolescent Psychiatry, and National Center for Child Traumatic Stress), 9/08, reaffirmed 8/12

COUNCIL ON INJURY, VIOLENCE, AND POISON PREVENTION (FORMER COMMITTEE ON INJURY, VIOLENCE, AND POISON PREVENTION)

All-Terrain Vehicle Injury Prevention: Two-, Three-, and Four-Wheeled Unlicensed Motor Vehicles, 6/00, reaffirmed 5/04, 1/07, 5/13

Bicycle Helmets, 10/01, reaffirmed 1/05, 2/08, 11/11

Child Fatality Review (joint with Committee on Child Abuse and Neglect and Council on Community Pediatrics), 8/10, reaffirmed 5/14

Child Passenger Safety, 3/11

Child Passenger Safety (Technical Report), 3/11

Children in Pickup Trucks, 10/00, reaffirmed 5/04, 1/07

Falls From Heights: Windows, Roofs, and Balconies, 5/01, reaffirmed 10/04, 5/07, 6/10

Firearm-Related Injuries Affecting the Pediatric Population, 10/12

Fireworks-Related Injuries to Children, 7/01, reaffirmed 1/05, 2/08, 10/11

The Hospital Record of the Injured Child and the Need for External Cause-of-Injury Codes, 2/99, reaffirmed 5/02, 5/05, 10/08, 10/13

Injuries Associated With Infant Walkers, 9/01, reaffirmed 1/05, 2/08, 10/11

Injury Risk of Nonpowder Guns (Technical Report), 11/04, reaffirmed 2/08, 10/11

In-line Skating Injuries in Children and Adolescents (joint with Committee on Sports Medicine and Fitness), 4/98, reaffirmed 1/02, 1/06, 1/09, 11/11

Intimate Partner Violence: The Role of the Pediatrician (Clinical Report) (joint with Committee on Child Abuse and Neglect), 4/10, reaffirmed 1/14

Lawn Mower-Related Injuries to Children, 6/01, reaffirmed 10/04, 5/07, 6/10

Lawn Mower-Related Injuries to Children (Technical Report), 6/01, reaffirmed 10/04, 5/07, 6/10

Office-Based Counseling for Unintentional Injury Prevention (Clinical Report), 1/07

Pedestrian Safety, 7/09, reaffirmed 8/13

Personal Watercraft Use by Children and Adolescents, 2/00, reaffirmed 5/04, 1/07, 6/10

Prevention of Agricultural Injuries Among Children and Adolescents (joint with Committee on Community Health Services), 10/01, reaffirmed 1/07, 11/11

Prevention of Choking Among Children, 2/10

Prevention of Drowning, 5/10

Prevention of Drowning (Technical Report), 5/10

The Prevention of Unintentional Injury Among American Indian and Alaska Native Children: A Subject Review (Clinical Report) (joint with Committee on Native American Child Health), 12/99, reaffirmed 12/02, 1/06, 1/09

Reducing the Number of Deaths and Injuries From Residential Fires, 6/00

Restraint Use on Aircraft, 11/01, reaffirmed 5/05, 10/08

Role of the Pediatrician in Youth Violence Prevention, 6/09

Safe Transportation of Newborns at Hospital Discharge, 10/99, reaffirmed 1/03, 1/06, 10/08

Safe Transportation of Preterm and Low Birth Weight Infants at Hospital Discharge (Clinical Report) (joint with Committee on Fetus and Newborn), 4/09, reaffirmed 8/13

School Bus Transportation of Children With Special Health Care Needs, 8/01, reaffirmed 1/05, 2/08, 5/13

School Transportation Safety (joint with Council on School Health), 7/07, reaffirmed 10/11

Shopping Cart–Related Injuries to Children, 8/06, reaffirmed 4/09, 8/13

Shopping Cart–Related Injuries to Children (Technical Report), 8/06, reaffirmed 4/09, 8/13

Skateboard and Scooter Injuries, 3/02, reaffirmed 5/05, 10/08, 10/13

Snowmobiling Hazards, 11/00, reaffirmed 5/04, 1/07, 6/10

Swimming Programs for Infants and Toddlers (joint with Committee on Sports Medicine and Fitness), 4/00, reaffirmed 5/04

The Teen Driver (joint with Committee on Adolescence), 12/06, reaffirmed 6/10

Transporting Children With Special Health Care Needs, 10/99, reaffirmed 1/03, 1/06, 3/13

COUNCIL ON SCHOOL HEALTH (FORMERLY COMMITTEE ON SCHOOL HEALTH AND SECTION ON SCHOOL HEALTH)

Active Healthy Living: Prevention of Childhood Obesity Through Increased Physical Activity (joint with Council on Sports Medicine and Fitness), 5/06, reaffirmed 5/09, 8/12

Climatic Heat Stress and Exercising Children and Adolescents (joint with Council on Sports Medicine and Fitness), 8/11

Corporal Punishment in Schools, 8/00, reaffirmed 6/03, 5/06, 2/12

Creating Healthy Camp Experiences, 3/11

The Crucial Role of Recess in School, 12/12

Disaster Planning for Schools, 10/08, reaffirmed 9/11

Guidance for the Administration of Medication in School, 9/09, reaffirmed 2/13

Head Lice (Clinical Report) (joint with Committee on Infectious Diseases), 7/10

Home, Hospital, and Other Non–School-based Instruction for Children and Adolescents Who Are Medically Unable to Attend School, 11/00, reaffirmed 6/03, 5/06

Honoring Do-Not-Attempt-Resuscitation Requests in Schools (joint with Committee on Bioethics), 4/10, reaffirmed 7/13

The Inappropriate Use of School “Readiness” Tests (joint with Committee on Early Childhood, Adoption, and Dependent Care), 3/95, reaffirmed 4/98, 1/04, 4/10

Medical Emergencies Occurring at School, 10/08, reaffirmed 9/11

Organized Sports for Children and Preadolescents (joint with Committee on Sports Medicine and Fitness), 6/01, reaffirmed 1/05, 6/11

Out-of-School Suspension and Expulsion, 2/13

Preventing and Treating Homesickness (Clinical Report), 1/07, reaffirmed 5/12

Returning to Learning Following a Concussion (Clinical Report) (joint with Council on Sports Medicine and Fitness), 10/13

The Role of Schools in Combating Illicit Substance Abuse (joint with Committee on Substance Abuse), 12/07

Role of the School Nurse in Providing School Health Services, 5/08

Role of the School Physician, 12/12

School Health Assessments, 4/00, reaffirmed 6/03, 5/06, 10/11

School Health Centers and Other Integrated School Health Services, 1/01

School Readiness (Technical Report) (joint with Committee on Early Childhood, Adoption, and Dependent Care), 4/08, reaffirmed 9/13

School Start Times for Adolescents (joint with Adolescent Sleep Working Group and Committee on Adolescence), 8/14

School Transportation Safety (joint with Committee on Injury, Violence, and Poison Prevention), 7/07, reaffirmed 10/11

School-Based Health Centers and Pediatric Practice, 1/12

School-Based Mental Health Services, 6/04, reaffirmed 5/09

Soft Drinks in Schools, 1/04, reaffirmed 1/09

COUNCIL ON SPORTS MEDICINE AND FITNESS (FORMERLY COMMITTEE ON SPORTS MEDICINE AND FITNESS AND SECTION ON SPORTS MEDICINE AND FITNESS)

Active Healthy Living: Prevention of Childhood Obesity Through Increased Physical Activity (joint with Council on School Health), 5/06, reaffirmed 5/09, 8/12

Anterior Cruciate Ligament Injuries: Diagnosis, Treatment, and Prevention (Clinical Report) (joint with Section on Orthopaedics), 4/14

Athletic Participation by Children and Adolescents Who Have Systemic Hypertension, 5/10, reaffirmed 5/13

Baseball and Softball, 2/12

Boxing Participation by Children and Adolescents (joint with Canadian Paediatric Society), 8/11

Cheerleading Injuries: Epidemiology and Recommendations for Prevention, 10/12

Climatic Heat Stress and Exercising Children and Adolescents (joint with Council on School Health), 8/11

Human Immunodeficiency Virus and Other Blood-borne Viral Pathogens in the Athletic Setting, 12/99, reaffirmed 1/05, 1/09, 11/11

Injuries in Youth Soccer (Clinical Report), 1/10, reaffirmed 5/13

In-line Skating Injuries in Children and Adolescents (joint with Committee on Injury and Poison Prevention), 4/98, reaffirmed 1/02, 1/06, 1/09, 11/11

Intensive Training and Sports Specialization in Young Athletes, 7/00, reaffirmed 11/04, 1/06, 5/09

Medical Concerns in the Female Athlete, 9/00, reaffirmed 5/05, 5/08

Medical Conditions Affecting Sports Participation (Clinical Report), 4/08, reaffirmed 5/11, 6/14

Organized Sports for Children and Preadolescents (joint with Committee on School Health), 6/01, reaffirmed 1/05, 6/11

Overuse Injuries, Overtraining, and Burnout in Child and Adolescent Athletes (Clinical Report), 6/07, reaffirmed 3/11, 6/14

Promotion of Healthy Weight-Control Practices in Young Athletes, 12/05

Protective Eyewear for Young Athletes (joint with American Academy of Ophthalmology), 3/04, reaffirmed 2/08, 6/11

Reducing Injury Risk From Body Checking in Boys' Youth Ice Hockey, 5/14

Returning to Learning Following a Concussion (Clinical Report) (joint with Council on School Health), 10/13

Sport-Related Concussion in Children and Adolescents (Clinical Report), 8/10, reaffirmed 8/14

Sports Drinks and Energy Drinks for Children and Adolescents: Are They Appropriate? (Clinical Report) (joint with Committee on Nutrition), 5/11

Strength Training by Children and Adolescents, 4/08, reaffirmed 6/11

Swimming Programs for Infants and Toddlers (joint with Committee on Injury and Poison Prevention), 4/00, reaffirmed 5/04

Trampoline Safety in Childhood and Adolescence, 9/12

Use of Performance-Enhancing Substances, 4/05, reaffirmed 5/08

DISASTER PREPAREDNESS ADVISORY COUNCIL

Pediatric Anthrax Clinical Management (Clinical Report) (joint with Committee on Infectious Diseases), 4/14

Pediatric Anthrax Clinical Management: Executive Summary (Clinical Report) (joint with Committee on Infectious Diseases), 4/14

JOINT COMMITTEE ON INFANT HEARING

Supplement to the JCIH 2007 Position Statement: Principles and Guidelines for Early Intervention After Confirmation That a Child Is Deaf or Hard of Hearing, 3/13

Year 2007 Position Statement: Principles and Guidelines for Early Hearing Detection and Intervention Programs, 10/07

MEDICAL HOME IMPLEMENTATION PROJECT ADVISORY COMMITTEE

Patient- and Family-Centered Care Coordination: A Framework for Integrating Care for Children and Youth Across Multiple Systems (joint with Council on Children With Disabilities), 4/14

MEDICAL HOME INITIATIVES FOR CHILDREN WITH SPECIAL NEEDS PROJECT ADVISORY COMMITTEE

Identifying Infants and Young Children With Developmental Disorders in the Medical Home: An Algorithm for Developmental Surveillance and Screening (joint with Council on Children With Disabilities, Section on Developmental and Behavioral Pediatrics, and Bright Futures Steering Committee), 7/06, reaffirmed 12/09, 8/14

The Medical Home, 7/02, reaffirmed 5/08

NEUROMOTOR SCREENING EXPERT PANEL

Motor Delays: Early Identification and Evaluation (Clinical Report), 5/13

NEWBORN SCREENING AUTHORIZING COMMITTEE

Newborn Screening Expands: Recommendations for Pediatricians and Medical Homes—Implications for the System (Clinical Report), 1/08

RETAIL-BASED CLINIC POLICY WORK GROUP

AAP Principles Concerning Retail-Based Clinics, 12/06, reaffirmed 1/11

SECTION ON ALLERGY AND IMMUNOLOGY

Allergy Testing in Childhood: Using Allergen-Specific IgE Tests (Clinical Report), 12/11

Effects of Early Nutritional Interventions on the Development of Atopic Disease in Infants and Children: The Role of Maternal Dietary Restriction, Breastfeeding, Timing of Introduction of Complementary Foods, and Hydrolyzed Formulas (Clinical Report) (joint with Committee on Nutrition), 1/08

Management of Food Allergy in the School Setting (Clinical Report), 11/10

Self-injectable Epinephrine for First-Aid Management of Anaphylaxis (Clinical Report), 3/07

SECTION ON ANESTHESIOLOGY AND PAIN MEDICINE

Do-Not-Resuscitate Orders for Pediatric Patients Who Require Anesthesia and Surgery (Clinical Report) (joint with Section on Surgery and Committee on Bioethics), 12/04, reaffirmed 1/09, 10/12

The Pediatrician's Role in the Evaluation and Preparation of Pediatric Patients Undergoing Anesthesia, 8/14

Premedication for Nonemergency Endotracheal Intubation in the Neonate (Clinical Report) (joint with Committee on Fetus and Newborn), 2/10, reaffirmed 8/13

Recognition and Management of Iatrogenically Induced Opioid Dependence and Withdrawal in Children (Clinical Report) (joint with Committee on Drugs), 12/13

Relief of Pain and Anxiety in Pediatric Patients in Emergency Medical Systems (Clinical Report) (joint with Committee on Pediatric Emergency Medicine), 10/12

SECTION ON BREASTFEEDING

Breastfeeding and the Use of Human Milk, 2/12

WIC Program, 11/01

SECTION ON CARDIOLOGY AND CARDIAC SURGERY

ACCF/AHA/AAP Recommendations for Training in Pediatric Cardiology (joint with American College of Cardiology Foundation and American Heart Association), 12/05, reaffirmed 1/09

Cardiovascular Health Supervision for Individuals Affected by Duchenne or Becker Muscular Dystrophy (Clinical Report), 12/05, reaffirmed 1/09

Cardiovascular Monitoring and Stimulant Drugs for Attention-Deficit/Hyperactivity Disorder (joint with Black Box Working Group), 8/08

Echocardiography in Infants and Children, 6/97, reaffirmed 3/03, 3/07

Endorsement of Health and Human Services Recommendation for Pulse Oximetry Screening for Critical Congenital Heart Disease, 12/11

Guidelines for Pediatric Cardiovascular Centers, 3/02, reaffirmed 10/07

Pediatric Sudden Cardiac Arrest, 3/12

Role of Pulse Oximetry in Examining Newborns for Congenital Heart Disease: A Scientific Statement from the AHA and AAP (joint with Committee on Fetus and Newborn and American Heart Association Congenital Heart Defects Committee of the Council on Cardiovascular Disease in the Young, Council on Cardiovascular Nursing, and Interdisciplinary Council on Quality of Care and Outcomes Research), 8/09

Ventricular Fibrillation and the Use of Automated External Defibrillators on Children (joint with Committee on Pediatric Emergency Medicine), 11/07, reaffirmed 6/11, 7/14

SECTION ON CLINICAL PHARMACOLOGY AND THERAPEUTICS

Fever and Antipyretic Use in Children (Clinical Report) (joint with Committee on Drugs), 2/11

SECTION ON COMPLEMENTARY AND INTEGRATIVE MEDICINE (FORMERLY PROVISIONAL SECTION ON COMPLEMENTARY, HOLISTIC, AND INTEGRATIVE MEDICINE)

Sensory Integration Therapies for Children With Developmental and Behavioral Disorders (joint with Council on Children With Disabilities), 5/12

The Use of Complementary and Alternative Medicine in Pediatrics (Clinical Report) (joint with Task Force on Complementary and Alternative Medicine), 12/08, reaffirmed 10/12, 1/13

SECTION ON CRITICAL CARE

Admission and Discharge Guidelines for the Pediatric Patient Requiring Intermediate Care (Clinical Report) (joint with Committee on Hospital Care and Society of Critical Care Medicine), 5/04, reaffirmed 2/08, 1/13

Guidelines for Developing Admission and Discharge Policies for the Pediatric Intensive Care Unit (joint with Committee on Hospital Care and Society of Critical Care Medicine), 4/99, reaffirmed 5/05, 2/08, 1/13

Guidelines for the Determination of Brain Death in Infants and Children: An Update of the 1987 Task Force Recommendations (Clinical Report) (joint with Section on Neurology, Society of Critical Care Medicine, and Child Neurology Society), 8/11

Management of Pediatric Trauma (joint with Section on Orthopaedics, Committee on Pediatric Emergency Medicine, Section on Surgery, Section on Transport Medicine, and Pediatric Orthopaedic Society of North America), 4/08, reaffirmed 4/13

Pediatric Organ Donation and Transplantation (joint with Committee on Hospital Care and Section on Surgery), 3/10, reaffirmed 3/14

SECTION ON DERMATOLOGY

Atopic Dermatitis: Skin-Directed Management (Clinical Report), 11/14

Ultraviolet Radiation: A Hazard to Children and Adolescents (joint with Council on Environmental Health), 2/11

Ultraviolet Radiation: A Hazard to Children and Adolescents (Technical Report) (joint with Council on Environmental Health), 3/11

SECTION ON DEVELOPMENTAL AND BEHAVIORAL PEDIATRICS

Early Childhood Adversity, Toxic Stress, and the Role of the Pediatrician: Translating Developmental Science Into Lifelong Health (joint with Committee on Psychosocial Aspects of Child and Family Health and Committee on Early Childhood, Adoption, and Dependent Care), 12/11

Identifying Infants and Young Children With Developmental Disorders in the Medical Home: An Algorithm for Developmental Surveillance and Screening (joint with Council on Children With Disabilities, Bright Futures Steering Committee, and Medical Home Initiatives for Children With Special Needs Project Advisory Committee), 7/06, reaffirmed 12/09, 8/14

The Lifelong Effects of Early Childhood Adversity and Toxic Stress (Technical Report) (joint with Committee on Psychosocial Aspects of Child and Family Health and Committee on Early Childhood, Adoption, and Dependent Care), 12/11

SECTION ON ENDOCRINOLOGY

Bone Densitometry in Children and Adolescents (Clinical Report), 12/10

Congenital Adrenal Hyperplasia (Technical Report) (joint with Committee on Genetics), 12/00, reaffirmed 10/04

Evaluating Children With Fractures for Child Physical Abuse (Clinical Report), (joint with Committee on Child Abuse and Neglect; Section on Radiology; Section on Orthopaedics; and Society for Pediatric Radiology), 1/14

Prevention and Treatment of Type 2 Diabetes Mellitus in Children, With Special Emphasis on American Indian and Alaska Native Children (Clinical Report) (joint with Committee on Native American Child Health), 10/03, reaffirmed 10/08

Screening for Retinopathy in the Pediatric Patient With Type 1 Diabetes Mellitus (Clinical Report) (joint with Section on Ophthalmology and American Association for Pediatric Ophthalmology and Strabismus), 7/05, reaffirmed 1/09, 7/14

Update of Newborn Screening and Therapy for Congenital Hypothyroidism (Clinical Report) (joint with Committee on Genetics, American Thyroid Association, and Lawson Wilkins Pediatric Endocrine Society), 6/06, reaffirmed 12/11

SECTION ON GASTROENTEROLOGY, HEPATOLOGY, AND NUTRITION

Gastroesophageal Reflux: Management Guidance for the Pediatrician (Clinical Report), 4/13

Probiotics and Prebiotics in Pediatrics (Clinical Report) (joint with Committee on Nutrition), 11/10

SECTION ON HEMATOLOGY/ONCOLOGY

Evaluating for Suspected Child Abuse: Conditions That Predispose to Bleeding (Technical Report) (joint with Committee on Child Abuse and Neglect), 3/13

Evaluation for Bleeding Disorders in Suspected Child Abuse (Clinical Report) (joint with Committee on Child Abuse and Neglect), 3/13

Guidelines for Pediatric Cancer Centers, 6/04, reaffirmed 10/08

Health Supervision for Children With Sickle Cell Disease (joint with Committee on Genetics), 3/02, reaffirmed 1/06, 1/11

Long-term Follow-up Care for Pediatric Cancer Survivors (Clinical Report) (joint with Children's Oncology Group), 3/09, reaffirmed 4/13

Preservation of Fertility in Pediatric and Adolescent Patients With Cancer (Technical Report) (joint with Committee on Bioethics and Section on Surgery), 5/08, reaffirmed 2/12

Standards for Pediatric Cancer Centers, 7/14

SECTION ON HOME CARE

Financing of Pediatric Home Health Care (joint with Committee on Child Health Financing), 8/06

SECTION ON HOSPICE AND PALLIATIVE MEDICINE

Pediatric Palliative Care and Hospice Care Commitments, Guidelines, and Recommendations (joint with Committee on Hospital Care), 10/13

SECTION ON HOSPITAL MEDICINE

Guiding Principles for Pediatric Hospital Medicine Programs, 9/13

Medical Staff Appointment and Delineation of Pediatric Privileges in Hospitals (Clinical Report) (joint with Committee on Hospital Care), 3/12

Physicians' Roles in Coordinating Care of Hospitalized Children (Clinical Report) (joint with Committee on Hospital Care), 9/10

SECTION ON INTEGRATED MEDICINE

Physician Health and Wellness (Clinical Report) (joint with Committee on Practice and Ambulatory Medicine), 9/14

SECTION ON INTERNATIONAL CHILD HEALTH

Increasing Antiretroviral Drug Access for Children With HIV Infection (joint with Committee on Pediatric AIDS), 4/07, reaffirmed 4/10

SECTION ON MEDICAL STUDENTS, RESIDENTS, AND FELLOWSHIP TRAINEES

Parental Leave for Residents and Pediatric Training Programs (joint with Committee on Early Childhood), 1/13

SECTION ON NEUROLOGICAL SURGERY

Prevention and Management of Positional Skull Deformities in Infants (Clinical Report) (joint with Committee on Practice and Ambulatory Medicine), 11/11

SECTION ON NEUROLOGY

Guidelines for the Determination of Brain Death in Infants and Children: An Update of the 1987 Task Force Recommendations (Clinical Report) (joint with Section on Critical Care, Society of Critical Care Medicine, and Child Neurology Society), 8/11

SECTION ON OPHTHALMOLOGY

Eye Examination in Infants, Children, and Young Adults by Pediatricians (joint with Committee on Practice and Ambulatory Medicine, American Association of Certified Orthoptists, American Association for Pediatric Ophthalmology and Strabismus, and American Academy of Ophthalmology), 4/03, reaffirmed 5/07

The Eye Examination in the Evaluation of Child Abuse (Clinical Report) (joint with Committee on Child Abuse and Neglect), 7/10

Instrument-Based Pediatric Vision Screening Policy Statement (joint with Committee on Practice and Ambulatory Medicine, American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 10/12

Learning Disabilities, Dyslexia, and Vision (joint with Council on Children With Disabilities, American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 7/09, reaffirmed 7/14

Learning Disabilities, Dyslexia, and Vision (Technical Report) (joint with Council on Children With Disabilities, American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 3/11

Ophthalmologic Examinations in Children With Juvenile Rheumatoid Arthritis (Clinical Report) (joint with Section on Rheumatology), 5/06, reaffirmed 10/12

Red Reflex Examination in Neonates, Infants, and Children (joint with American Association for Pediatric Ophthalmology and Strabismus, American Academy of Ophthalmology, and American Association of Certified Orthoptists), 12/08

Screening Examination of Premature Infants for Retinopathy of Prematurity (joint with American Academy of Ophthalmology, American Association for Pediatric Ophthalmology and Strabismus, and American Association of Certified Orthoptists), 12/12

Screening for Retinopathy in the Pediatric Patient With Type 1 Diabetes Mellitus (Clinical Report) (joint with Section on Endocrinology and American Association for Pediatric Ophthalmology and Strabismus), 7/05, reaffirmed 1/09, 7/14

SECTION ON ORAL HEALTH (FORMERLY SECTION ON PEDIATRIC DENTISTRY AND SECTION ON PEDIATRIC DENTISTRY AND ORAL HEALTH)

Fluoride Use in Caries Prevention in the Primary Care Setting, 8/14

Maintaining and Improving the Oral Health of Young Children, 11/14

Management of Dental Trauma in a Primary Care Setting (Clinical Report), 1/14

Oral Health Care for Children With Developmental Disabilities (Clinical Report) (joint with Council on Children With Disabilities), 2/13

Oral Health Risk Assessment Timing and Establishment of the Dental Home, 5/03, reaffirmed 5/09

Preventive Oral Health Intervention for Pediatricians, 12/08

SECTION ON ORTHOPAEDICS

Anterior Cruciate Ligament Injuries: Diagnosis, Treatment, and Prevention (Clinical Report) (joint with Council on Sports Medicine), 4/14

Evaluating Children With Fractures for Child Physical Abuse (Clinical Report), (joint with Committee on Child Abuse and Neglect; Section on Radiology; Section on Endocrinology; and Society for Pediatric Radiology), 1/14

Management of Pediatric Trauma (joint with Committee on Pediatric Emergency Medicine, Section on Critical Care, Section on Surgery, Section on Transport Medicine, and Pediatric Orthopaedic Society of North America), 4/08, reaffirmed 4/13

SECTION ON OTOLARYNGOLOGY—HEAD & NECK SURGERY

Cochlear Implants in Children: Surgical Site Infections and Prevention and Treatment of Acute Otitis Media and Meningitis (joint with Committee on Infectious Diseases), 7/10

Follow-up Management of Children With Tympanostomy Tubes, 2/02

Hearing Assessment in Infants and Children: Recommendations Beyond Neonatal Screening (Clinical Report) (joint with Committee on Practice and Ambulatory Medicine), 9/09

SECTION ON RADIOLOGY

Diagnostic Imaging of Child Abuse, 4/09

Evaluating Children With Fractures for Child Physical Abuse (Clinical Report), (joint with Committee on Child Abuse and Neglect; Section on Endocrinology; Section on Orthopaedics; and Society for Pediatric Radiology), 1/14

Radiation Risk to Children From Computed Tomography (Clinical Report), 9/07

SECTION ON RHEUMATOLOGY

Ophthalmologic Examinations in Children With Juvenile Rheumatoid Arthritis (Clinical Report) (joint with Section on Ophthalmology), 5/06, reaffirmed 10/12

SECTION ON SURGERY

Assessment and Management of Inguinal Hernia in Infants (Clinical Report) (joint with Committee on Fetus and Newborn), 9/12

Do-Not-Resuscitate Orders for Pediatric Patients Who Require Anesthesia and Surgery (Clinical Report) (joint with Section on Anesthesia and Pain Medicine and Committee on Bioethics), 12/04, reaffirmed 1/09, 10/12

Management of Pediatric Trauma (joint with Section on Orthopaedics, Committee on Pediatric Emergency Medicine, Section on Critical Care, Section on Transport Medicine, and Pediatric Orthopaedic Society of North America), 4/08, reaffirmed 4/13

Pediatric Organ Donation and Transplantation (joint with Committee on Hospital Care and Section on Critical Care), 3/10, reaffirmed 3/14

Postdischarge Follow-up of Infants With Congenital Diaphragmatic Hernia (Clinical Report) (joint with Committee on Fetus and Newborn), 3/08, reaffirmed 5/11

Preservation of Fertility in Pediatric and Adolescent Patients With Cancer (Technical Report) (joint with Committee on Bioethics and Section on Hematology/Oncology), 5/08, reaffirmed 2/12

Prevention and Management of Pain in the Neonate: An Update (joint with Committee on Fetus and Newborn and Canadian Paediatric Society), 11/06, reaffirmed 5/10

SECTION ON TELEHEALTH CARE (FORMERLY SECTION ON TELEPHONE CARE)

Payment for Telephone Care (joint with Committee on Child Health Financing), 10/06

SECTION ON TRANSPORT MEDICINE

Management of Pediatric Trauma (joint with Section on Orthopaedics, Committee on Pediatric Emergency Medicine, Section on Critical Care, Section on Surgery, and Pediatric Orthopaedic Society of North America), 4/08, reaffirmed 4/13

SECTION ON UNIFORMED SERVICES

Health and Mental Health Needs of Children in US Military Families (Clinical Report) (joint with Committee on Psychosocial Aspects of Child and Family Health), 5/13

STEERING COMMITTEE ON QUALITY IMPROVEMENT AND MANAGEMENT

ADHD: Clinical Practice Guideline for the Diagnosis, Evaluation, and Treatment of Attention-Deficit/Hyperactivity Disorder in Children and Adolescents (Clinical Practice Guideline) (joint with Subcommittee on Attention-Deficit/Hyperactivity Disorder), 10/11

Chronic Abdominal Pain in Children (Clinical Report) (joint with Subcommittee on Chronic Abdominal Pain and North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition), 3/05

Chronic Abdominal Pain in Children (Technical Report) (joint with Subcommittee on Chronic Abdominal Pain and North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition), 3/05

Classifying Recommendations for Clinical Practice Guidelines, 9/04

Developmental Dysplasia of the Hip Practice Guideline (Technical Report), 4/00

Diagnosis and Management of Acute Otitis Media (Clinical Practice Guideline) (joint with American Academy of Family Physicians), 5/04

Diagnosis and Management of an Initial UTI in Febrile Infants and Young Children (Technical Report) (joint with Subcommittee on Urinary Tract Infection), 8/11

Diagnosis and Management of Childhood Obstructive Sleep Apnea Syndrome (Clinical Practice Guideline) (joint with Subcommittee on Obstructive Sleep Apnea Syndrome), 8/12

Diagnosis and Management of Childhood Obstructive Sleep Apnea Syndrome (Technical Report) (joint with Subcommittee on Obstructive Sleep Apnea Syndrome), 8/12

Early Detection of Developmental Dysplasia of the Hip (Clinical Practice Guideline), 4/00

An Evidence-Based Review of Important Issues Concerning Neonatal Hyperbilirubinemia (Technical Report) (joint with Subcommittee on Hyperbilirubinemia), 7/04

Febrile Seizures: Clinical Practice Guideline for the Long-term Management of the Child With Simple Febrile Seizures (Clinical Practice Guideline) (joint with Subcommittee on Febrile Seizures), 6/08

Management of Hyperbilirubinemia in the Newborn Infant 35 or More Weeks of Gestation (Clinical Practice Guideline) (joint with Subcommittee on Hyperbilirubinemia), 7/04

Management of Sinusitis (Clinical Practice Guideline), 9/01

Otitis Media With Effusion (Clinical Practice Guideline) (joint with Subcommittee on Otitis Media With Effusion), 5/04

Principles for the Development and Use of Quality Measures (joint with Committee on Practice and Ambulatory Medicine), 2/08

Principles of Pediatric Patient Safety: Reducing Harm Due to Medical Care (joint with Committee on Hospital Care), 5/11

Toward Transparent Clinical Policies, 3/08, reaffirmed 2/14

Urinary Tract Infection: Clinical Practice Guideline for the Diagnosis and Management of the Initial UTI in Febrile Infants and Children 2 to 24 Months (Clinical Practice Guideline) (joint with Subcommittee on Urinary Tract Infection), 8/11

SUBCOMMITTEE ON ATTENTION-DEFICIT/HYPERACTIVITY DISORDER

ADHD: Clinical Practice Guideline for the Diagnosis, Evaluation, and Treatment of Attention-Deficit/Hyperactivity Disorder in Children and Adolescents (Clinical Practice Guideline) (joint with Steering Committee on Quality Improvement and Management), 10/11

SUBCOMMITTEE ON CHRONIC ABDOMINAL PAIN

Chronic Abdominal Pain in Children (Clinical Report) (joint with Steering Committee on Quality Improvement and Management and North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition), 3/05

Chronic Abdominal Pain in Children (Technical Report) (joint with Steering Committee on Quality Improvement and Management and North American Society for Pediatric Gastroenterology, Hepatology, and Nutrition), 3/05

SUBCOMMITTEE ON FEBRILE SEIZURES

Febrile Seizures: Clinical Practice Guideline for the Long-term Management of the Child With Simple Febrile Seizures (Clinical Practice Guideline) (joint with Steering Committee on Quality Improvement and Management), 6/08

Febrile Seizures: Guideline for the Neurodiagnostic Evaluation of the Child With a Simple Febrile Seizure (Clinical Practice Guideline), 2/11

SUBCOMMITTEE ON HYPERBILIRUBINEMIA

An Evidence-Based Review of Important Issues Concerning Neonatal Hyperbilirubinemia (Technical Report) (joint with Steering Committee on Quality Improvement and Management), 7/04

Management of Hyperbilirubinemia in the Newborn Infant 35 or More Weeks of Gestation (Clinical Practice Guideline) (joint with Steering Committee on Quality Improvement and Management), 7/04

SUBCOMMITTEE ON OBSTRUCTIVE SLEEP APNEA SYNDROME

Diagnosis and Management of Childhood Obstructive Sleep Apnea Syndrome (Clinical Practice Guideline) (joint with Steering Committee on Quality Improvement and Management), 8/12

Diagnosis and Management of Childhood Obstructive Sleep Apnea Syndrome (Technical Report) (joint with Steering Committee on Quality Improvement and Management), 8/12

SUBCOMMITTEE ON OTITIS MEDIA WITH EFFUSION

Otitis Media With Effusion (Clinical Practice Guideline) (joint with Steering Committee on Quality Improvement and Management), 5/04

SUBCOMMITTEE ON URINARY TRACT INFECTION

Diagnosis and Management of an Initial UTI in Febrile Infants and Young Children (Technical Report) (joint with Steering Committee on Quality Improvement and Management), 8/11

Urinary Tract Infection: Clinical Practice Guideline for the Diagnosis and Management of the Initial UTI in Febrile Infants and Children 2 to 24 Months (Clinical Practice Guideline) (joint with Steering Committee on Quality Improvement and Management), 8/11

SURGICAL ADVISORY PANEL

Referral to Pediatric Surgical Specialists, 1/14

TASK FORCE ON CIRCUMCISION

Circumcision Policy Statement, 8/12

Male Circumcision (Technical Report), 8/12

TASK FORCE ON COMPLEMENTARY AND ALTERNATIVE MEDICINE

The Use of Complementary and Alternative Medicine in Pediatrics (Clinical Report) (joint with Provisional Section on Complementary, Holistic, and Integrative Medicine), 12/08, reaffirmed 10/12, 1/13

TASK FORCE ON GRADUATE MEDICAL EDUCATION REFORM

Graduate Medical Education and Pediatric Workforce Issues and Principles, 6/94

TASK FORCE ON MENTAL HEALTH

The Future of Pediatrics: Mental Health Competencies for Pediatric Primary Care (joint with Committee on Psychosocial Aspects of Child and Family Health), 6/09, reaffirmed 8/13

TASK FORCE ON SUDDEN INFANT DEATH SYNDROME

The Changing Concept of Sudden Infant Death Syndrome: Diagnostic Coding Shifts, Controversies Regarding the Sleeping Environment, and New Variables to Consider in Reducing Risk, 11/05, reaffirmed 5/08

SIDS and Other Sleep-Related Infant Deaths: Expansion of Recommendations for a Safe Infant Sleeping Environment, 10/11

SIDS and Other Sleep-Related Infant Deaths: Expansion of Recommendations for a Safe Infant Sleeping Environment (Technical Report), 10/11

TASK FORCE ON TERRORISM

The Pediatrician and Disaster Preparedness (joint with Committee on Pediatric Emergency Medicine and Committee on Medical Liability), 2/06, reaffirmed 6/09, 9/13

Psychosocial Implications of Disaster or Terrorism on Children: A Guide for the Pediatrician (Clinical Report) (joint with Committee on Psychosocial Aspects of Child and Family Health), 9/05

WORK GROUP ON SEDATION

Guidelines for Monitoring and Management of Pediatric Patients During and After Sedation for Diagnostic and Therapeutic Procedures: An Update (Clinical Report) (joint with American Academy of Pediatric Dentistry), 12/06, reaffirmed 3/11

WORKING GROUP ON SLEEPINESS IN ADOLESCENTS/YOUNG ADULTS

Excessive Sleepiness in Adolescents and Young Adults: Causes, Consequences, and Treatment Strategies (Technical Report) (joint with Committee on Adolescence), 6/05

JOINT STATEMENTS

Joint Statement of the American Academy of Pediatrics and the American Academy of Child and Adolescent Psychiatry

Psychological Maltreatment (Clinical Report), 7/12

Joint Statement of the American Academy of Pediatrics, the American Academy of Child and Adolescent Psychiatry, and the National Center for Child Traumatic Stress

Behavioral and Emotional Consequences of Child Abuse (Clinical Report), 9/08, reaffirmed 8/12

Joint Statement of the American Academy of Pediatrics and the American Academy of Family Physicians

Diagnosis and Management of Acute Otitis Media (Clinical Practice Guideline), 5/04

Joint Statement of the American Academy of Pediatrics, the American Academy of Family Physicians, and the American College of Physicians

Supporting the Health Care Transition From Adolescence to Adulthood in the Medical Home (Clinical Report), 7/11

Joint Statement of the American Academy of Pediatrics, the American Academy of Family Physicians, and the American College of Physicians-American Society of Internal Medicine

A Consensus Statement on Health Care Transitions for Young Adults With Special Health Care Needs, 12/02

Joint Statement of the American Academy of Pediatrics and the American Academy of Ophthalmology

Protective Eyewear for Young Athletes, 3/04, reaffirmed 2/08, 6/11

Joint Statement of the American Academy of Pediatrics, the American Academy of Ophthalmology, the American Association for Pediatric Ophthalmology and Strabismus, and the American Association of Certified Orthoptists

Instrument-Based Pediatric Vision Screening Policy Statement, 10/12

Screening Examination of Premature Infants for Retinopathy of Prematurity, 12/12

Joint Statement of the American Academy of Pediatrics and the American Academy of Pediatric Dentistry

Guidelines for Monitoring and Management of Pediatric Patients During and After Sedation for Diagnostic and Therapeutic Procedures: An Update (Clinical Report), 12/06, reaffirmed 3/11

Oral and Dental Aspects of Child Abuse and Neglect (Clinical Report), 12/05, reaffirmed 1/09, 1/14

Joint Statement of the American Academy of Pediatrics, the American Association of Certified Orthoptists, the American Association for Pediatric Ophthalmology and Strabismus, and the American Academy of Ophthalmology

Eye Examination in Infants, Children, and Young Adults by Pediatricians, 4/03, reaffirmed 5/07

Learning Disabilities, Dyslexia, and Vision, 7/09, reaffirmed 7/14

Learning Disabilities, Dyslexia, and Vision (Technical Report), 3/11

Red Reflex Examination in Neonates, Infants, and Children, 12/08

Joint Statement of the American Academy of Pediatrics and the American Association for Pediatric Ophthalmology and Strabismus

Screening for Retinopathy in the Pediatric Patient With Type 1 Diabetes Mellitus (Clinical Report), 7/05, reaffirmed 1/09, 7/14

Joint Statement of the American Academy of Pediatrics, the American College of Cardiology Foundation, and the American Heart Association

ACCF/AHA/AAP Recommendations for Training in Pediatric Cardiology, 12/05, reaffirmed 1/09

Joint Statement of the American Academy of Pediatrics and the American College of Emergency Physicians

Emergency Information Forms and Emergency Preparedness for Children With Special Health Care Needs, 3/10, reaffirmed 7/14

Patient- and Family-Centered Care and the Role of the Emergency Physician Providing Care to a Child in the Emergency Department, 11/06, reaffirmed 6/09, 10/11

Pediatric Mental Health Emergencies in the Emergency Medical Services System, 10/06, reaffirmed 6/09, 4/13

Joint Statement of the American Academy of Pediatrics; the American College of Emergency Physicians; the American College of Surgeons Committee on Trauma; Emergency Medical Services for Children; the Emergency Nurses Association; the National Association of EMS Physicians; and the National Association of State EMS Officials

Equipment for Ground Ambulances, 8/14

APPENDIX 2

PPI: AAP Partnership for Policy Implementation

BACKGROUND

The American Academy of Pediatrics (AAP) develops policies that promote attainment of optimal physical, mental, and social health and well-being for all infants, children, adolescents, and young adults. These documents are valued highly not only by clinicians who provide direct health care to children but by members of other organizations who share similar goals and by parents, payers, and legislators. Unfortunately, AAP policy documents vary widely in terms of how they are written, and some find these documents difficult to implement. Pediatricians who have expertise in medical informatics found AAP policy documents particularly challenging when they tried to convert policy recommendations into items that could be easily programmed into an electronic system. In June 2005, with initial funding support from the federal Maternal and Child Health Bureau, the AAP launched the Partnership for Policy Implementation (PPI), a pilot program to create changes in development of policy statements, clinical reports, technical reports, and clinical practice guidelines—specifically, how they are written. The PPI process is a collaboration between informaticians and subject matter experts that integrates health information technology (HIT) functionalities into AAP policy. The PPI is currently funded by the AAP Child Health Informatics Center (CHIC).

VISION

The vision of the PPI is that all AAP clinical recommendations include clear guidance on how pediatricians can implement those recommendations into their patient care and that AAP clinical guidance can be easily incorporated within electronic health record decision-support systems.

MISSION

The mission of the PPI is to facilitate implementation of AAP recommendations at the point of care by ensuring that AAP documents are written in a practical, action-oriented fashion with unambiguous recommendations.

WHAT IS THE PPI?

The PPI is a network of pediatric informaticians who work with AAP authors and guideline subcommittees throughout the writing process.

Contributions of the PPI to the AAP writing process include disambiguation and specification; development of clear definitions; clearly defined logic; implementation

techniques; action-oriented recommendations, including clinical algorithms; transparency of evidence basis for recommendations; and health information technology (HIT) standard development.

WHAT HAS THE PPI ACCOMPLISHED?

Since inception of the PPI, more than 20 statements have been published using the PPI process, covering a wide variety of child health topics, including child passenger safety (*Pediatrics*. 2011;127:788–793), harm reduction (*Pediatrics*. 2011; 127:1199–1210), type 2 diabetes (*Pediatrics*. 2013; 131:364–382), and bronchiolitis (*Pediatrics*. 2014; 134:e1474–e1502).

One example of how a statement developed using PPI process has gained broader acceptance is the AAP annual influenza statement. Since 2007, the Centers for Disease Control and Prevention have adopted components of the PPI statement (specifically, the clinical algorithm) within its own statement on the same topic. In addition, the Childhood Influenza Immunization Coalition posted an interactive version of the influenza algorithm on its Web site (www.preventchildhoodinfluenza.org/resource/algorithm.swf).

WHAT IS THE PPI DOING NOW?

In addition to creating practical, action-oriented documents that pediatricians can use, the PPI is also working to make it easier for these documents to be incorporated into electronic systems. To date, the PPI has focused its involvement on the statement development process. Involvement of the PPI during the writing process helps to produce a clear, more concise document. As these standards of care become well documented, the PPI can begin to focus on building or mapping pediatric vocabulary; once solidified, this vocabulary can be built into electronic health record (EHR) systems. The standards of care can also be matched to various logical and functional HIT standards that already exist today. Through this work, the PPI improves AAP policy documents by providing specific guidance to pediatricians at the point of care, helping ensure that EHRs are designed to assist pediatricians in providing optimal care for children.

For more information about the PPI, please visit its Web site (<http://www2.aap.org/informatics/PPI.html>) or contact Lisa Krams (lkrams@aap.org or 847/434-7663).

A

- AAP. *See* American Academy of Pediatrics (AAP)
- Abdominal pain in children, 1084
- Abnormalities
 - evaluation and management of, in urinary tract infections, 428–431
 - obstructive sleep apnea syndrome and behavioral, 365–366
 - subtle neurologic, associated with hyperbilirubinemia, 190
- Abortion, adolescent's right to confidential care when considering, 1075
- Abstinence, 580, 608
- Abuse. *See* Child abuse; Sexual abuse; Substance abuse
- ACA. *See* Affordable Care Act (ACA) (2010)
- Access to antiretroviral drugs for children with HIV infection, 1116
- Access to emergency care, 1073
- Accidents. *See* Hazards; Injuries; Safety
- Acetabulum, maldevelopments of, 132
- Achondroplasia, health supervision for children with, 1109
- ACL injuries, 491
 - clinical report regarding, 1076
 - consequences of, 493–494
 - diagnosing, 495–496
 - epidemiology of, 492
 - gender differences, 492–493
 - guidance for clinicians, 499–500
 - mechanisms of, 494
 - prevention of, 498–499
 - return to sport, 498
 - risk factors, 494–495
 - treatment of, 496–498
- Acquired immunodeficiency syndrome (AIDS). *See* Human immunodeficiency virus (HIV) infection
- Acute bacterial sinusitis, 305–344
 - adjuvant therapy, 319
 - intranasal steroids, 319
 - nasal decongestants, mucolytics, and antihistamines, 319
 - saline irrigation, 319
 - ancillary treatments
 - decongestant-antihistamine for, 332
 - mucolytic agents for, 333–334
 - nasal spray for, 332–333
 - steroids for, 332
 - antibiotics for, 313–314
 - antimicrobials for, 328–331, 336
 - adverse effects associated with, 331–332
 - clinical findings
 - duration of symptoms, 334
 - imaging studies, 311–312, 334
 - laboratory studies, 334
 - signs and symptoms, 334
 - coding quick reference for, 341
 - complications of, 321
 - definitions of acute, subacute, and recurrent, 335
 - diagnosis of, 334, 343
 - confirmation of, 318–319
 - presumptive, 309–311
 - distinguishing, from cold, 343
 - epidemiology of, 335–336
 - etiology of, 322
 - fluid inside the sinuses, 343
 - future research on, 321–322
 - initial management of, 312
 - key action statements on, 309–319, 341
 - orbital or central nervous system complications of, 312
 - pediatric guidelines, 336
 - persistence of, 313–314
 - recurrence of, 319–321
 - subacute, 334–335
 - symptoms of, 344
 - worsening of, 317–318
 - treating, 322, 343–344
- Acute bilirubin encephalopathy, 183
 - clinical manifestations of, 188
- Acute care, 827
- Acute ear infections, 301–302
 - complications of, 302
 - development of, 301
 - ear pain in, 302
 - hearing problems in, 302
 - otitis media with effusion and, 301–302
 - risk of, 301
 - symptoms of, 301–302
 - treatment of, 302
- Acute otitis media (AOM), 235–304
 - antibiotics for, 247–260, 263
 - bacterial susceptibility to, 255–256
 - failure of initial, 257–258
 - breastfeeding and, 261, 262
 - complementary and alternative medicine and, 263
 - defined, 239
 - diagnosis of, 242–246, 263
 - distinguishing otitis media with effusion from, 245
 - follow-up of patient with, 258
 - future research on, 262
 - glossary of terms, 239–240
 - influenza vaccine and, 260, 262
 - initial observation for, 251–253
 - key action statements on, 238–239, 242–264
 - lifestyle changes and, 262
 - nonsevere, 239
 - pneumococcal vaccine and, 260, 261–262
 - prevention and treatment of meningitis and, in children with cochlear implants, 1085
 - recurrent, 239, 263
 - surgery for, 259–260
 - severe, 239
 - signs and symptoms of, 243–245
 - tobacco smoke exposure and, 262
 - treatment of, 246–247
 - duration of, 258
 - initial, 263
 - uncomplicated, 239
 - xylitol and, 262
- Acute streptococcal pharyngitis, rheumatic fever and diagnosis and treatment of, 1183
- AD. *See* Atopic dermatitis (AD)
- Adenotonsillar hypertrophy, 373
- Adenotonsillectomy
 - high-risk patients undergoing, 399
 - obstructive sleep apnea syndrome and, 351–353, 399
 - after postoperative persistence of, 376–377
 - postoperative management after, 375–376
- ADHD. *See* Attention-deficit/hyperactivity disorder (ADHD)
- Admission guidelines
 - for pediatric intensive care unit, 1105–1106
 - for pediatric patient requiring intermediate care, 1074
- Adolescent(s). *See also* Children; Minors; Youth
 - advertising and, 1082
 - alcohol use by, 1075
 - athletic participation by, who have systemic hypertension, 1077
 - attention-deficit/hyperactivity disorder in, 8, 13, 14, 15, 17, 43, 45–47
 - bone acquisition, 808
 - bone densitometry in, 1078
 - bone health. *See* Bone health
 - caffeine intake, 719
 - care of
 - parents and their children, 1080
 - sexual assault victim, 1080
 - condom use by, 487
 - consensus statement of insurance coverage of mental health and substance abuse services for, 1119
 - consent for emergency medical services for, 1087
 - contraceptives. *See* Contraception
 - depression in, 454
 - dietary recommendations for, 1178

Adolescent(s), *continued*

- with disabilities. *See* Children with disabilities
 - disclosure of illness status to, with human immunodeficiency virus infection, 1092
 - as drivers, 1168
 - electronic media and insufficient sleep, 717–718
 - excessive sleepiness in, 1100
 - exercising, and climatic heat stress, 1084–1085
 - expedited partner therapy for, diagnosing with chlamydia or gonorrhea, 1179
 - gynecologic examination for, in pediatric office setting, 1107
 - health care for, in juvenile justice system, 1108
 - home, hospital, and other non-school-based instruction for non-school-attending, 1111
 - human immunodeficiency virus infection in
 - postexposure prophylaxis for nonoccupational exposure to, 1143
 - role of pediatricians in prevention and intervention, 1075
 - role of pediatricians in promoting routine testing, 1074–1075

Pediatric Clinical Practice Guidelines & Policies CD-ROM, 15th Edition

Software Requirements

Windows®: Windows 98 or newer; current Internet browser (eg, Internet Explorer, Mozilla Firefox, Opera, Chrome, Safari) with Active Content, Java, and JavaScript enabled; Java 1.4 or newer.

Macintosh®: Mac OS X 10.3.4 or newer (older version will not be able to search), current Internet browser (eg, Safari 1.3.1, Mozilla Firefox, Chrome, Opera) with Java and JavaScript enabled, Java 1.4.1 or newer.

Unix®/Linux®: Current Internet browser supporting Java and JavaScript (eg, Mozilla Firefox, Opera), Java 1.4 or newer.

Adobe Reader® 5.0 or newer (7.0.5 or newer recommended). Free download available at www.adobe.com.

Installation Instructions

Windows®

1. Insert the disc into the CD-ROM drive.
- 2a. To run without installing, open to D:\start.html.
- 2b. Open D drive, double-click on Setup.exe, and follow the prompts. (If your CD-ROM drive is not D, use the appropriate letter.)
3. To launch the program, click the desktop icon or go to Start>Programs>American Academy of Pediatrics and click the title.

Macintosh®

1. Insert the disc into the CD-ROM drive.
2. To run without installing, click start.html in the CD-ROM directory.
3. If you would like to install the files, copy start.html and the contents of the “data” folder to your hard drive.

Technical Support

American Academy of Pediatrics

Pediatric Clinical Practice Guidelines & Policies

A Compendium of Evidence-based Research for Pediatric Practice 15th Edition

Clinical practice guidelines have long provided physicians with an evidence-based decision-making tool for managing common pediatric conditions. Policies issued and endorsed by the American Academy of Pediatrics (AAP) represent the AAP position on child health care issues.

More than 30 clinical practice guidelines and more than 500 policy statements, clinical reports, and technical reports have been combined into this 15th edition of *Pediatric Clinical Practice Guidelines & Policies* book and CD-ROM, giving you even easier access to the important clinical and policy information you need.

Manual includes

- Complete AAP clinical practice guidelines
- Complete 2014 AAP policy statements and clinical and technical reports
- Appendixes on policies by committee, the AAP Partnership for Policy Implementation, and AAP acronyms
- Quick Reference Tools including coding tips, patient education handouts, and more
- Six-section organization for ease of use

CD-ROM includes

- Complete AAP clinical practice guidelines
- Complete text of all AAP policies through December 2014
- Full search capabilities
- AAP-endorsed policy statements from other medical groups

Clinical practice guidelines included in this edition cover the following pediatric conditions:

- Attention-deficit/hyperactivity disorder
- Autism
- Bronchiolitis—New!
- Cerebral palsy
- Community-acquired pneumonia
- Congenital adrenal hyperplasia
- Depression
- Diabetes
- Dialysis
- Dysplasia of the hip
- Endocarditis
- Febrile seizures
- Fluoride
- Food allergy
- Gastroenteritis
- Gastroesophageal reflux
- Group B streptococcal disease
- *Helicobacter pylori* infection
- Hematopoietic stem cell transplant
- Human immunodeficiency virus
- Hyperbilirubinemia
- Influenza
- Intravascular catheter-related infections
- Jaundice
- Methicillin-resistant *Staphylococcus aureus*
- Migraine headache
